CONGRATULATIONS

You have just acquired the most advanced component for the control and processing of audio and video ever to have been developed.

IMPORTANT

Save all packaging in a dry place away from fire hazards. Your Casablanca III HD is a precision electronic instrument and should be properly packaged any time shipment is made. In the unlikely event that you have to return your Casablanca III HD to the factory for service, or if you send it to us for updating, the original packaging will best protect the unit from shipping damage.

In order to achieve the fullest flexibility and enjoyment from your Casablanca III HD, we at Theta recommend that you read this manual in full before connecting the unit to your audio/video system.

WARNING

United Stated law prohibits disposition of these commodities to Libya, Laos, North Korea, Cambodia or Cuba unless otherwise authorized by the United States.

NOTE:

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio and television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

* Reorient or relocate the receiving antenna.
* Increase the separation between equipment and receiver.
* Connect the receiver into an outlet on a circuit different from that which the Casablanca III HD is connected to.

Acknowledgments

Casablanca III HD is manufactured under license from Dolby Laboratories. “Dolby”, “Pro Logic”, “Dolby TrueHD” and the double-D symbol are registered trademarks of Dolby Laboratories.

WARNING

TO REDUCE THE RISK OF FIRE OR ELECTRIC SHOCK,
DO NOT EXPOSE THIS PRODUCT TO RAIN OR MOISTURE
Casablanca III HD Identification Record

This information is for your records and for future identification of the Casablanca III HD. Please take a moment to fill out all pertinent data now, and as upgrades and/or options are installed. **Whenever upgrades, inquiries and/or changes are requested, the serial number will be required.**

SAFETY PRECAUTIONS

Please carefully read each item of the operating instructions and safety precautions before using this product. Use extra care to follow the warnings written on the product itself and/or in the operating instructions. Keep the operating instructions and safety precautions for future reference.

CAUTION: TO REDUCE THE RISK OF ELECTRICAL SHOCK, DO NOT REMOVE ANY OF THE COVER PANELS.

NO USER-SERVICEABLE PARTS INSIDE. REFER ALL SERVICING TO QUALIFIED SERVICE PERSONNEL ONLY.

TO PREVENT FIRE OR SHOCK HAZARD, DO NOT ALLOW LIQUIDS TO SPILL OR OBJECTS TO FALL INTO ANY OPENINGS OF THE PRODUCT.

THIS UNIT IS SUPPLIED WITH A 3 PIN GROUNDED AC PLUG. ALWAYS INSERT THE AC PLUG INTO A GROUNDED OUTLET. DO NOT REMOVE THE GROUND PIN OR DISABLE THE GROUND FOR ANY PURPOSE.

BEFORE MAKING ANY CONNECTIONS TO THE CASABLANCA III HD, FIRST TURN OFF THE POWER AND THEN DISCONNECT THE AC POWER CORD.

WHEN INSTALLING THE CASABLANCA III HD IN YOUR SYSTEM, MAKE CERTAIN TO ALLOW A MINIMUM OF 3 INCHS OF VENTILATION ON EACH SIDE OF THE UNIT. ALSO ALLOW AT LEAST 3⅛ INCHS OF VENTILATION SPACE ABOVE THE UNIT. IMPROPER VENTILATION OF THE UNIT MAY CAUSE OVERHEATING, WHICH MAY DAMAGE THE UNIT AND CAUSE A FIRE. PLACE THE UNIT ON A SOLID SURFACE ONLY. I.E. NOT ON CARPET, ETC.

DO NOT PLACE THE CASABLANCA III HD NEAR HEAT SOURCES SUCH AS DIRECT SUNLIGHT, STOVES, HEAT REGISTERS, RADIATORS OR OTHER HEAT PRODUCING EQUIPMENT.

TO PREVENT DAMAGE TO THE ANALOG OUTPUT CIRCUITRY, BE CERTAIN NOT TO SHORT THE OUTPUT SIGNAL PIN(S) TO GROUND. ENSURE THAT YOUR AUDIO OUTPUT CABLES DO NOT HAVE ANY INTERNAL SHORTS BEFORE CONNECTING THEM TO THE CASABLANCA III HD.

IF REPLACEMENT OF THE AC LINE FUSE BECOMES NECESSARY, REPLACE ONLY WITH SAME VALUE AND TYPE OF FUSE. NEVER BYPASS THE FUSE.

IF THE AC CORD BECOMES DAMAGED, DO NOT USE IT. IMMEDIATELY REPLACE IT WITH A NEW ONE OF THE SAME OR BETTER RATING.

AFTER MARKET and THIRD PARTY MODIFICATIONS

Please note that any after market and/or third party modifications will void the warranty. In the case of changing the feet on a unit, in order to prevent any damage (which will also not be covered under warranty), please verify that the screws being used to secure non Casablanca III HD feet do not screw any deeper into the chassis than the original ones. The original screw is 10-32 by 3/8 and goes into the chassis 1/5 inch.
INTRODUCTION

Welcome to a new world of possibilities. Casablanca III HD is by far the most advanced surround sound processor/home theater controller available today. It offers the advantages of Theta’s legendary mastery in digital signal processing and sound quality unapproachable by any other equipment.

Getting to know your Casablanca III HD

Despite Casablanca III HD’s great technical sophistication, we believe in making it as easy as possible for you to use. We think you’ll enjoy the intuitive way the Casablanca III HD works. Rather than offer a frustrating bewilderment of little used functions in constant view vying for your attention, Casablanca III HD is structured systematically by function.

The “user interface” is based on simple logic. For example, when a function button is pressed, you can make changes within its menu(s) and press the same function button again to exit that function. (The same button that got you in gets you back out).

This Casablanca III HD has been put through a rigorous and unique testing procedure that insures that it will last for many years with minimal service requirements. This procedure includes the following:

- All assembled circuit boards are given a thorough visual inspection and are then tested in a bench-reference Casablanca III HD.
- The tested assembled circuit boards are installed in a new Casablanca III HD and the whole unit is tested for every function and parameter.
- The unit is put on a burn-in torture rack for 100 hours to test for any possible component failures.
- The Casablanca III HD is tested on an audio analyzer for all pertinent parameters.
- The Casablanca III HD is put through a final bench test wherein every possible feature, mode and parameter is checked.
- The unit has all remaining chassis components installed and then undergoes a complete visual inspection, which assures that all Casablanca III HDs meet visual specifications.
- The unit is then put through a critical listening test.

Burn In Time

This unit has a break in period of about 1 week during which continuous improvement in sound quality will be observed. It is recommended that music be played continuously through the unit during this time to expedite the break in period.
IMPORTANT NOTICE

I. Due to the computer-based circuitry used in Theta products, it is imperative that the Casablanca III HD be connected to a ground via its three wire AC power cord. It is important that the AC power outlet which the Casablanca III HD is plugged into, is actually grounded. Failure to do so will severely compromise the performance, reliability and safety of use of the Casablanca III HD.

II. It is important to prevent contact with static electricity when connecting other components and cables to the Casablanca III HD. When connecting cables, simply place one hand on top of the Casablanca III HD and then grasp the metal "barrel" of the cable with the other hand and plug (unplug) the cable into (from) the appropriate jack on the Casablanca III HD.

III. The Casablanca III HD, as with all electronic equipment, is susceptible to static discharges. Resetting the unit may be required if anomalies occur after receiving a static discharge. In this case, put the unit in standby and turn off the rear panel power switch for 2 minutes, and then turn it on again.

IV. Ventilation is an important issue when placing the Casablanca III HD in a system. Make certain that the Casablanca III HD is placed in a well-ventilated area or rack unit.

V. Please take note that some powerline conditioners defeat the AC power ground on their outlets. If the intention is to plug the Casablanca III HD into a line conditioner, check with your dealer to make certain that the particular conditioner that is intended for use DOES NOT DEFEAT THE AC GROUND on its AC outlets.

VI. DO NOT remove any cover panels from the Casablanca III HD, as there are no user serviceable components inside. Refer servicing and updating to qualified service personnel only.

VII. Should the Casablanca III HD need to be reset, it must be put in standby first via the front panel power button. Then the rear panel power switch is to be turned off for at least 2 minutes.

VIII. The Casablanca III HD can be susceptible to excessive RF. End caps on all unused inputs will improve the sound quality and may reduce the susceptibility to RF induced anomalies.

Reference Manual Conventions

For clarity purposes, references to buttons, LEDs and display parameters will be shown in BOLD CAPITOL letters.

All functions to be performed from, and in reference to, the front panel of the Casablanca III HD will be found in the front section of this manual. All functions to be performed using the hand held remote and/or viewed on a video monitor will be found in the back, or last part of this manual.
## Glossary of Terms and Abbreviations

<table>
<thead>
<tr>
<th>TERM</th>
<th>DEFINITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES/EBU (Audio Engineering Society) / (European Broadcasters Union)</td>
<td>A three wire balanced digital audio standard. This interface uses a 3-pin XLR connector and allows for data communication between digital audio equipment.</td>
</tr>
<tr>
<td>Analog-to-Digital Converter</td>
<td>A device that converts analog signals into a digital format. Once encoded, all audio is stored or processed as a series of numbers rather than as the audio itself.</td>
</tr>
<tr>
<td>Balanced Audio Signals</td>
<td>Signals that are carried on three-conductor cables (AES/EBU), with two of the conductors carrying the same signal 180° out of phase and the third as ground. Balanced connections usually cost more than unbalanced connections, but are less susceptible to picking up hum and prevent interference with low-level signals.</td>
</tr>
<tr>
<td>Center Spread</td>
<td>A proprietary Theta Digital process whereby the front center speaker signal can be incrementally spread evenly between the front left and right speakers.</td>
</tr>
<tr>
<td>dB</td>
<td>Decibel, a relative unit of loudness.</td>
</tr>
<tr>
<td>Dolby 3 Stereo</td>
<td>The Dolby 3 Stereo mode reproduces sound using only the 3 front channels, and is intended to be used either before surround speakers are installed, or for programs that might benefit from deriving a center channel output, but where the quality of the surround output is unsatisfactory.</td>
</tr>
<tr>
<td>Digital-to-Analog Converter</td>
<td>A device that converts digital signals into an analog format.</td>
</tr>
<tr>
<td>Hz (Hertz)</td>
<td>A unit of frequency.</td>
</tr>
<tr>
<td>IR</td>
<td>Infrared. A method of wireless transmission of data.</td>
</tr>
<tr>
<td>LFE</td>
<td>Low Frequency Effect. Commonly a discrete audio track designated for a sub woofer.</td>
</tr>
<tr>
<td>mS</td>
<td>Millisecond, or 1/1000 of a second.</td>
</tr>
<tr>
<td>Oversampling</td>
<td>The process of creating more sample points in order to more accurately reconstruct a digitized signal for playback in the analog domain.</td>
</tr>
<tr>
<td>Phantom Center Mode</td>
<td>Redirects the center channel signal equally to the front left and right outputs, thus creating the illusion of a center speaker. This mode is intended for use when no center speaker is present.</td>
</tr>
<tr>
<td>Phantom Surround Mode</td>
<td>Intended for use when no surround speakers are present in the system. The surround information is added to the front channels. If the current mode is Dolby Pro Logic, the Casablanca III HD will automatically decode in Dolby 3 Stereo.</td>
</tr>
<tr>
<td>Sampling Rate</td>
<td>The rate at which an analog (real world) signal is converted into digital numeric values.</td>
</tr>
<tr>
<td>TRS</td>
<td>Tip, Ring, Sleeve. Names of the 3 connecting elements of a stereo phono jack or plug.</td>
</tr>
<tr>
<td>Unbalanced Audio Signals (AKA single-ended)</td>
<td>Signals that are carried on two-conductor cables, one “hot”, or signal, and one ground.</td>
</tr>
<tr>
<td>Xover</td>
<td>Abbreviation for the word 'Crossover'.</td>
</tr>
</tbody>

Figure 4 - Block Diagram of Xtreme D-2 4-Channel DAC board

Figure 5 - Block Diagram of Digital Output board
Front Panel Layout

1. 40 character by 2 row blue vacuum florescent display (VFD).
2. **DISPLAY** button. Temporarily overrides the VFD brightness display setting in the **SETUP/INP** page 1 submenu.
3. **POWER** LED. Lights when the Casablanca III HD is in standby mode.
4. **MAIN POWER** button. After the rear panel **MAIN POWER** switch is turned on, press the front panel **POWER** button to exit standby mode. The VFD will display the last selected **INPUT SELECT** menu. Pressing this button again will place the Casablanca III HD into standby mode and the LED above the front panel **POWER** button will light.
5. **REMOTE POWER** button. Activates/deactivates the **REMOTE POWER** jack on the rear panel.
6. Buttons 1 through 6. Used to select a desired input on **INPUT SELECT** pages, or parameter to change when in a submenu. The LED over the button lights when the button is pressed. These buttons are referred to as the **INPUT SELECT** buttons.
7. **MODE** button. Activates the **MODE** select menus for the currently selected input. Allows the user to temporarily override the default **MODE** for the current **INPUT**. Will not show modes that are automatically selected.
8. **TAPE OUT** button. Used for routing audio and video **INPUT** signals to the **TAPE OUT** jacks.
9. **SET-UP** button. Used for setting speaker configurations/levels/delays, analog input levels, naming inputs, setting the display & remote power jack time-out delays, selecting between NTSC and PAL video sources and accessing additional surround parameters, and all other **SETUP** functions.
10. **BALANCE** button. Sets temporary speaker balance configurations, shelf EQ, and analog input levels to compensate for different program characteristics.
11. **A-D** button. Sequences through input jacks mapped (assigned) to the active **INPUT SELECT** button.
12. **MUTE** button. Mutes/unmutes all audio outputs with the exception of the **TAPE OUT** jacks.
13. **ANALOG LEVEL** display. Shows input level, in dB, of currently selected analog input.
14. **HDMI** indicator. Lights when the unit is turned on. It is one indicator that the unit accepts HDMI.
15. **DOLBY TRUEHD** indicator. Lights when the unit is turned on. It is one indicator that the unit processes Dolby's lossless codec.
16. **DTS-HD MASTER AUDIO** indicator. Lights when the unit is turned on. It is one indicator that the unit processes DTS lossless codec.
17. **LOCK** light. Lights when a valid digital signal is detected on the selected input.
18. **LEVEL LEFT** and **RIGHT** buttons. Shifts audio balance to the left and right when the **BALANCE** function is selected, adjusts the master volume within submenus when the **LEVEL UP/DOWN** buttons are to be used for parameter value editing, used to toggle between the 2 input select pages, shifts to the next character when editing names.
19. **LEVEL UP** and **DOWN** buttons. Increases/decreases master volume. Also used to increment/decrement values in most edit modes, and shifts **FRONT/REAR** audio balance in **BALANCE** submenu.
20. **1** through **6** LED indicators. Light when buttons **1** through **6** are selected.
Figure 7 - Rear Panel Layout

1. **Main Power Switch.** Master power switch. Disconnects AC to all circuits. It is recommended that this be left ON at all times during regular use, except when cables are connected/disconnected or when the unit will not be used for an extended period of time.

2. **RS232 DB9 and RJ45 connectors.**

2a. **AC Power Connector:** 3 wire, IEC 320 connector with an EMI filter.

3. **USB Connector:** Alternative connector for firmware updates.

4. **Remote Power** jack. Activated/deactivated when associated front panel or remote button is pressed/pressed again.

5. **Main Power 1** jack. Activated/deactivated when front panel POWER button is pressed/pressed again. All Main Power jacks can output a 12V pulse (variable duration) or continuous 12VDC.

6. **Main Power 2** jack. Activated when front panel POWER button is pressed once, plus x seconds. X represents the time value that is stored in the **SET-UP/GLOBAL/REM PWR/MTIM** parameter. This jack is deactivated when the front panel POWER button is pressed again (putting the Casablanca III HD in Standby mode).

7. **Main Power 3** jack. Activated when front panel POWER button is pressed once, plus two times x seconds. X represents the time value that is stored in the **SET-UP/GLOBAL/REM PWR/MTIM** parameter. This jack is deactivated when the front panel POWER button is pressed again (putting the Casablanca III HD in Standby mode).

8. **Remote Extender** jack. An externally mounted (remote) Infrared (IR) receiver plugs into this miniature stereo phone jack. (Its signal must be demodulated). Please refer to Appendix C on page 99 for additional information.

9. **Power Supply Module.**

10. **HDMI Input/output card.** Accepts up to 4 HDMI 1.4 inputs (compatible with HDMI 1.1, 1.2, 1.3, etc.) Provides one HDMI 1.4 output. Audio is processed within the Casablanca III HD. Video is passed through untouched.

11. **Main Digital Input** card. Six Coaxial (RCA) and two TosLink inputs are provided for digital audio signals in the S/PDIF format at 32K, 44.1K 48K or 96KHz sampling rates. There are two open spaces provided for optional AT&T optical input module(s). There are two RCA digital Tape Out connectors on this card whose digital source can be selected in the **TAPE OUT** menu.

12. **Auxiliary Digital Input** card. This card provides one AES/EBU (balanced XLR) input, one BNC and one TosLink input. There is one Volume Data Out port.

13. **Analog Input** card. Six stereo RCA inputs are provided for line level analog output devices such as VCR,
laserdisc, CD and DAT players, phono preamplifiers, external D/A converters, tape decks, AM/FM tuners, etc. There are two pairs of analog tape outs for recording purposes, whose source can be selected in the **TAPE OUT** menu.

14. **First Analog Output** card. This slot could contain one of the following: A four-channel Xtreme D-2 quality DAC (pictured), a four-channel Premium quality DAC card, or a 3-channel Superior II quality DAC card. The 3-channel Superior II balanced cards also has single-ended outputs. The Xtreme D-2 card and the Premium card do not have single-ended outputs. The channel sets that can be routed to a Superior II, Premium or Xtreme D-2 card (in any DAC slot) are listed on pages 15 and 16 respectively, as well as in the specifications section of this manual.

15. **Second Analog Output** card. This slot could contain one of the following options: A four-channel Xtreme D-2 quality DAC, a four-channel Premium quality DAC card, or a 3-channel Superior II quality DAC card (pictured). If only two 3-channel balanced analog output cards are installed, this slot would typically contain outputs for sub, left surround and right surround channels.

16. **Third Analog Output** card. This slot could contain one of the following options: A four-channel Xtreme D-2 quality DAC, a four-channel Premium quality DAC card (pictured), or a 3-channel Superior II quality DAC card.

***

A 12-channel balanced digital output card can be installed in any of the 3 slots. It supports signals up to 192 kHz sampling rate and 24-bit word depth and can be used to send signals to an external DAC like Theta Digital's Generation VIII Series 3.
Figure 8 - All Superior II D/A Card Options
Each Premium and Xtreme D-2 DAC card can have one of the following speaker sets (channels) assigned to them, regardless of which DAC slot it (they) are installed to:

- Front Left, Right, Center, Surround Center or Sub 5
- Front Left, Right, Side Left, Right
- Sub 1, Sub 2, Sub 3, Sub 4
- Side Left, Right, Sub 3, Sub 4
- Front Left, Right, Sub 1, Sub 2
- Surround Left, Right, Sub 1, Sub 2
- Surround Left, Right, Sub 2, Sub 3
- Front Center, Sub 1, Sub 2, Sub 3
- Front Center, Sub 1, Surround Left, Right
- Front Left, Right, Surround Left, Right
- Surround Left, Right, Side Left, Right
- Front Left, Right, Center, Sub 1
- Sub 1, Sub 2, Sub 3, Surround Center or Sub 5
- Surround Left, Right, Center or Sub 5, Sub 1
- Surround Left, Right, Center or Sub 5, Sub 2
- Front Center, Surround Center or Sub 5, Surround Left, Right
- Front Center, Surround Center or Sub 5, Side Left, Right
- Sub 2, Sub 3, Sub 4, Surround Center or Sub 5
- Front Left, Right, Center, Sub 2
- Front Left, Right, Center, Sub 3
- Front Left, Right, Center, Sub 4
- Sub 2, Sub 3, Side Left, Right
- Sub 2, Surround Center or Sub 5, Side Left, Right
- Front Center, Surround Left, Right, Sub 2
- Front Center Side Left, Right, Sub 2

Figure 9 - Xtreme DAC

Note: In figure 9, each output is shown with a number 1-4. Channel labels are available to better identify each output.

**Figure 10-Mode, Status, Balance, Tape Out Menus and Input Select Pages**
Introduction to the User interface

WARNING !! : PLEASE READ FIRST!

In the SETUP menu, the PW button allows the user to password protect the entire SET-UP function. In the SETUP/INPUT page 3 submenu, the PW button allows the user to password protect the currently selected input. When any PW button is selected, a prompt will be displayed asking the user if they are sure they want to change the current password (YES or NO). If YES is selected, the current password will be displayed, prompting the end-user to change the current password. The password does not have to be changed at this point, the same numbers that are currently displayed can be entered, using buttons 1-6 and/or A-D. Pressing A-D enters a zero. A password containing at least one zero is null, meaning no password. Therefore, to remove a password, press A-D at least once.

Please note that there are no passwords programmed into the Casablanca III HD when it is initially shipped.

PLEASE REMEMBER and/or WRITE DOWN YOUR PASSWORDS! If it/they are forgotten, all access to password protected areas will be denied!

The menu system within the Casablanca III HD consists of 1 to 3 layers, with the exception of the SET-UP menu. Some menus have multiple pages, which can be accessed by pressing the A/D button, with the exception of the INPUT SELECT menu, which uses the LEFT/RIGHT buttons. When a menu has additional pages associated with it, a right or left arrow will be displayed in the bottom right corner of the VFD. Please refer to figures 10 and 11 for an overall view of all menus, submenus and menu pages.

The SETUP menu contains a number of submenus, organized by setup function. All configuration parameters which can be stored for each INPUT SELECT button (by input). They are accessed in one of the 3 SETUP/INPUT submenus. Setup parameters that are not stored individually for each INPUT SELECT button are accessed in the two SETUP/GLOBAL submenus. All macros can be executed via the SETUP/MACROS submenu.

Once a parameter is selected for editing, pressing the LEVEL UP/DOWN buttons edits the parameter value, storing it at the same time. On any page, if the LEVEL UP/DOWN buttons are not used for editing a parameter value, they will adjust the master volume. Where the LEVEL UP/DOWN buttons are used for editing a parameter value, the LEVEL LEFT/RIGHT buttons will adjust the master volume. An exception to this is the first BALANCE page and the pages where input select buttons and input jacks are named. In a few cases, such as the MODE and POST PROCESS menus, simply pressing the 1-6 buttons makes a selection.

The function buttons are defined as the MODE, TAPE OUT, SET-UP, and BALANCE buttons. To exit a function the same function button can be pressed multiple times to exit, or another function button can be pressed at any time.

Before you begin

With all input options installed in a Casablanca III HD, there are up to 24 input jacks: 6 pairs of stereo analog audio, 14 digital audio and 4 HDMI. Each jack can be named for the piece of equipment plugged into it. It is recommended that this step be done first. (SETUP/GLOBAL/JACK NAMES).

Each INPUT SELECT button can have up to 6 audio and 6 video jacks mapped, or assigned. The INPUT SELECT button should be named for the function it will serve. There are a total of 12 INPUT SELECTs on two pages. Pressing the LEVEL LEFT/RIGHT buttons will toggle between these two pages of 6 inputs each.

The procedure for setting up each INPUT SELECT is outlined in the Step-By-Step Setup section.

Note: The order in which input jacks are assigned to an INPUT SELECT button determines the search order. Please refer to page 47 for additional information on source assignment (search order). When more than one input jack is assigned to a single INPUT SELECT button, toggling the A-D button [when the INPUT SELECT page is active in the front panel display] will select the next assigned input jack – both audio and video.
This flowchart shows all steps required to set up the Casablanca III HD in order to achieve the best possible sonic performance and to provide the simplest operation for all users. Instructions and detailed flowcharts for each step are contained on the following pages.
Step by Step Speaker Configuration

Casablanca III HD provides a comprehensive set of speaker configuration settings. These settings are believed to be the most complete ever offered in a home theater component and should allow any speaker to perform optimally regardless of speaker type. The following procedure is merely a guideline: room acoustics, speaker design/quality, music/film type, and personal preferences all have a part in these settings.

Using the Setup menu map diagram [Figure 11] on page 18 in this manual is recommended.

There are four major steps to setting up your Casablanca III HD. In recommended sequence, they are:

**Speaker Configuration & Crossovers:** permits proper signal routing in the Casablanca III HD and proper blending of main and subwoofer signals. Enables all speakers present in the system.

**Individual speaker levels:** compensates for different speaker and amplifier efficiencies.

**Delays:** compensates for different speaker distances from the listening position.

**Input Specific Setup:** All parameters that are specific to an individual input select button.

Each step plays a pivotal role in the overall sonic performance and should receive equal attention and care in adjustment.

### Speaker Configuration & Crossovers

Crossovers are most commonly located in a speaker cabinet. Their purpose is to keep energy at certain frequencies from reaching specific speaker elements (drivers), [e.g. keeping unwanted bass energy from the tweeters (see diagram at right).] Home theater applications use crossovers in the surround processor to send low pass information to a subwoofer and limit the low pass information sent to the main speakers. The purpose of this section, **SPEAKER CONFIGURATION**, is to properly set up the Casablanca III HD’s internal crossovers for optimal sound as well as enable all speakers in the system.

In this manual, a Speaker Set is defined as one or more speakers that are manipulated via a common parameter. For example, the crossover parameters for both the front left and right speakers are manipulated in the front left/right configuration submenu since the desired effect for the left speaker is also appropriate for the right. The other speaker ‘sets’ in the Casablanca III HD are the [surround left and right], the [side left and right], the [center] and the [center surround]. The speaker sets will be delimited by [ ].

Full speaker configurations are stored separately for each of the 12 input select buttons. This procedure will guide the user to set all configuration parameters for input # 1, and then copy these parameters to all other input select buttons.

In the Speaker configuration submenu, buttons 1-5 will access additional menus to setup a particular speaker or set of speakers. Button 6 will turn on the side speakers, if configured in the system. In each speaker set’s configuration submenu, pressing button # 5 will allow a change of the crossover type for that speaker set. There are three options for the crossover type: "Phase Perfect"; "Butterworth"; and "Linkwitz-Riley". Each crossover type has settings that are applicable only to that type. The Front [Left/Right], [Center], [L-R Surround] and [Center Surround] speaker configuration submenu contains a separate setup submenu for each of the three crossover types. It is recommended that each of the three crossover submenus be set up for each speaker. The user can then audition each crossover type to determine which sounds best on their system.

Following is a description of each crossover type to help the user better understand the sonic advantages of each:

**Phase Perfect**

This is a term coined for a type of crossover wherein the low pass portion is derived from the high pass. First, a high pass Butterworth crossover is performed. This gives two resulting signals: the high pass and the original, unaltered signal. Then, the high pass signal is subtracted from the original input signal, resulting in the low pass signal, which is usually routed to the subwoofer. An advantage of a Phase Perfect crossover is that if the high and low pass signals are added together, an exact replica of the original input signal results, thus the term "phase perfect". A potentially negative attribute of this type of crossover is that, due to phase relationships and vector mathematics, higher order filters (12, 18, 24 dB/octave) always produce 6dB/octave low pass slopes, in terms of electrical energy sent to the subwoofer. The high pass portion will have the expected 6, 12, 18 or 24 dB /octave slope. Due to this phenomenon,
this type of crossover is best suited for subwoofers that can operate linearly up to the 500 Hz range. Please consult your dealer or subwoofer manufacturer to determine if this is suitable for your particular subwoofer. If the subwoofer is capable of handling this range, this is potentially the best sounding of Casablanca III HD’s crossover types.

Butterworth

This is the most common type of crossover used in home theater, speakers and outboard electronic crossovers. Separate high and low pass slopes and crossover frequencies may be set for speaker sets [Left/Right], [Center], [Surround Left / Surround Right] and [Center Surround]. (The [Sides] duplicate the configuration and crossover parameters for the [L/R Surround] speakers). As with Phase Perfect and Linkwitz-Riley crossovers, it is possible to invert the phase of the low pass for each of these speaker sets. This allows precise tailoring of the subwoofer response to the main speaker's response. A negative attribute of this crossover type is that the high and low pass signals have different phase shifts.

Linkwitz-Riley

This type of crossover, developed in 1976 by Siegfried Linkwitz and Russ Riley, eliminates some of the inherent problems of Butterworth filters. Specifically, a Butterworth filter of 12, 18 or 24 dB/octave (or higher) slope exhibits different phase shifts between the high and low pass outputs. A Linkwitz-Riley alignment solves this problem, as it exhibits zero phase difference between outputs at all frequencies. Acoustically, this means that if the sound sources are in proper time-alignment, a smoother frequency response will be realized at the listening position. The Linkwitz-Riley crossover is only applicable to slopes of 12 and 24 dB/octave. A proper Linkwitz-Riley crossover with a 12dB slope should have the low pass portion inverted. This is done internally in the Casablanca III HD.

A note on crossovers

Casablanca III HD's complement of crossover options can at first appear daunting. Most surround sound processors offer a simple selection to set their crossovers: Speaker Small or Speaker Large. These simple settings do not take into account the huge variations in speaker design and room acoustics and more often than not results in non-optimal performance. We offer this rich set of options with the aim of superior performance. With this in mind, following are a few simple suggestions to make this process easier.

A note on home theater

There are a few common misconceptions about home theater and bass reproduction. Chief among them is that the ".1" or "LFE" channel contains most or all of the bass information. This is unequivocally false. The LFE channel contains sound effects such as explosions, rumbling and the like. All other channels (left, center, right, left surround,
right surround) often contain an equal amount of bass. Their bass, however, tends to be more related to the soundtrack, vocal material or localized sources such as a drum beating behind the listener. This is important to understand when setting up crossovers in the coming section.

Another misconception is that the center channel is "fill" and is of minor importance. Again, this is false. The center channel contains the lion's share of important information (particularly dialog) in the cinematic experience. It is critical that the center speaker be of the highest quality possible and special attention be given to its mounting and positioning.

Speaker Configuration & Crossovers – Con't.

1) Select Input # 1.

Connect a digital source to Coaxial Input 1 jack and verify that the input jack mapping is correct, i.e if the digital source is connected to the coax input jack # 1, press the A-D button until COAX 1 appears in the VFD above the A-D button.

2) With Input button # 1 selected:
   a) Go to the SUB CONFIG submenu.
   b) Set #SUBS to the number of subwoofers that are configured into the system.
   c) If no subwoofer is present, set #SUBS to 0. The subwoofer Full Range/Crossover setting has no effect in this case.

   **Note:** You will now be directed to set up crossovers as if a sub were present. There are some general rules that the Casablanca III HD follows in the special case of no subwoofers:

   **Case 1** - The front left/right speaker configuration is set to FULL:
   - If the center speaker is set to "crossover" its low pass signal will be sent to the left/right channels.
   - If the surround left/right and or the surround center speaker configuration is set to “crossover” its low pass signal will be sent to the front left/right speakers only if the mode is Dolby Digital or DTS.

   **Case 2** – The surround left/right speaker configuration is set to FULL:
   - If the center surround speaker is set to “crossover” its low pass signal will be sent to the left/right surround channels.

   **Case 3** - The front left/right configuration setting is XOVER or FUL/LP:
   - Any speaker that is set to crossover will lose its low pass signal. The front center will route its low pass signal to the front left/right speakers if the center configuration setting is XOVERLR.

3) Determine if the subwoofer needs to be sent a crossed over signal or a full range signal:
   a) It is preferable to defeat the subwoofer’s internal crossover and set SUB to XOVER. The crossovers in the Casablanca III HD have been engineered to be superior to any analog crossover, regardless of quality.
   b) If the subwoofer’s internal crossover cannot be defeated set the SUB to FULL.
   c) If the subwoofer must be sent a full range signal, set the crossover frequency on the subwoofer’s internal crossover to match that of the speaker set that is crossed over in the Casablanca III HD. Example:
      i) If the front left/right speaker set is crossed over to 60Hz, begin by setting the subwoofer’s internal crossover frequency at 60Hz and in the Casablanca III HD, set the slope to match that of the subwoofer’s slope when performing step # 8g. (Refer to the subwoofer’s documentation to determine its slope).
      ii) If multiple speaker sets are crossed over at different frequencies some experimentation will be required with the crossover frequency of the sub woofer. The same applies if the slopes are set differently for each speaker set. Begin by setting the subwoofer’s frequency and slope to match the [front left/right] values. Experiment with the subwoofer’s crossover frequency by moving it towards the crossover frequency of the [center], if installed.

4) Determine which speaker sets ([Front left/right], [Center], [left/right Surrounds], [center surround]) need crossovers.
   a) If no speaker set is present, the CFG setting should be PHANTOM or OFF. If there are no side speakers, the sides should be set to OFF.
   b) When a speaker set is set to PHANTOM, its signal is not lost. If the front center speaker is set to PHANTOM, the center channel signal will be routed to the front left/right speakers; if the surround center speaker is set to PHANTOM, surround channel signals will be re-routed to the surround left/right speakers. These re-routed signals can be adjusted in volume using the Phantom Level (PHLV) parameter. Begin with the phantom level parameter at 0 and make fine adjustments after the setup is complete.

   It is preferable that none of the speakers need a crossover, but is rarely practical. Keep in mind that with a 5.1 signal (Dolby Digital or DTS), any speaker can be confronted with a full amplitude signal at any frequency. Generally speaking, the smaller the speaker, the more limited its bass capabilities. If a speaker set doesn't need to be crossed over, that speaker sets' configuration (CFG) setting should be FULL. Another possible option is Full range with low pass (FUL/LP). With this setting, the speaker will be sent the full range signal, and a duplicate low
pass signal is sent to the subwoofer to augment its low bass performance. If all speaker sets are set to "FULL RANGE" or "PHANTOM", the following section (Steps 5-9) on setting crossovers may be skipped.

5) Determine whether or not the subwoofer can handle frequencies as high as 500Hz. If literature included with the subwoofer does not state this specification, call your dealer or subwoofer manufacturer. Commonly only top-of-the-line subwoofers meet this requirement.

6) If the subwoofer does meet the above requirement, first try the "PHASE PERFECT" crossover type.

7) If the subwoofer cannot handle frequencies as high as 500Hz, first try the "LINKWITZ-RILEY" crossover type.

8) Using a 2-channel CD, do the following for each of the three speaker sets (LT/RT, CEN, SURRND):
   a) Go to that speaker sets’ configuration menu.
   b) Determine if this speaker set can handle a full range signal.
   c) If the speaker sets’ specification is -3dB at higher than 50 Hz, set the CFG to XOVER.
   d) If the speaker sets’ specification is -3dB at 35-50Hz, set the CFG setting to FULL/LP.
   e) If the speaker sets’ specification is -3dB at 20 Hz, set the CFG setting to FULL.
   f) Set the crossover frequency in the Phase Perfect submenu. If a suck-out appears (lack of bass energy), then try increasing the setting. If the transition to the sub becomes obvious, a lower frequency is recommended.
   g) Set the crossover slope in the Phase Perfect submenu. Generally, the smaller the bass driver or the fewer the bass drive units, the steeper the required slope. A gentler slope (6dB, 12 dB / octave) is normally less intrusive and provides better blending of the main speakers into the sub. Some sub woofers can sound “tubby” with too shallow of a slope. A steeper slope (18dB, 24dB / octave) can provide greater dynamic range and clearer dialog.
   h) Try both settings of low pass phase. The correct setting is the one that produces the clearest, most solid bass.
   i) Repeat steps f, g and h for the Linkwitz-Riley and Butterworth crossovers, for each speaker set. In the Butterworth crossover submenu, it is recommended that the high crossover frequency and slope be set to the same values as the low crossover frequency and slope.
   j) Set the crossover type for each speaker set.

9) In the [Center] submenu, the center channel’s low pass signal may be routed to the [front left/right] channels instead of the usual subwoofer routing (XOVRLR). This is useful for center channels that have extremely limited low frequency response, i.e –3dB cutoff point around 120 Hz. Using this crossover type is an excellent tool to increase the intelligibility of dialog.

Speaker Levels

Setting up the speaker levels is best accomplished using the Casablanca III HD’s internal noise generator and an SPL meter. If the meter has ‘weighting’ options, “C” is preferable.

10) With Input # 1 selected, go to the speaker levels submenu.
   a) Activate the noise in the front left speaker. All speaker levels should be referenced to the front left and right speaker levels, whose reference levels should start at 0.
   b) Holding the SPL meter close in front of the user’s face, bring up the master volume (using the LEVEL LEFT/RIGHT buttons) until the SPL meter reads 75dB.
   c) Activate the noise in the front right speaker and, holding the SPL meter in the same position, adjust the speaker level up/down until the SPL meter reads 75dB.
   d) Repeat this procedure for the center speaker.
   e) Activate noise in the left surround speaker. Hold the SPL meter close to the left ear, point it towards the left surround speaker, and adjust the level until the SPL meter reads 75dB.
   f) Activate noise in the right surround speaker. Holding the SPL meter close to the right ear, adjust the level until the SPL meter reads 75dB.
   g) Activate noise in the left side speaker. Holding the SPL meter close to the left ear, adjust the level until the SPL meter reads 75dB.
   h) Activate noise in the right side speaker. Holding the SPL meter close to the right ear, adjust the level until the SPL meter reads 75dB.
   i) Activate noise in the center surround speaker. Holding the SPL meter close to the left, then right ear, adjust surround center speaker level until the SPL meter reads 75dB.
   j) Activate noise in Sub1 and point the SPL meter toward the sub woofer. Adjust the SUB level until the SPL meter reads 75dB. Note that there is greater margin for error due to the low frequency output of the subwoofer. Listening to a familiar passage and fine tuning the sub level(s) by ear in the final adjustments will be required.
   k) Activate noise in Sub 2, if configured into the system, and point the SPL meter toward the subwoofer.
Adjust the **SUB** level until the SPL meter reads 75dB.

l) Activate noise in Sub 3, if configured into the system, and point the SPL meter toward the subwoofer. Adjust the **SUB** level until the SPL meter reads 75dB.

m) Activate noise in Sub 4, if configured into the system, and point the SPL meter toward the subwoofer. Adjust the **SUB** level until the SPL meter reads 75dB.

n) Activate noise in Sub 5, if configured into the system, and point the SPL meter toward the subwoofer. Adjust the **SUB** level until the SPL meter reads 75dB.

o) Deactivate the noise generator with the **A-D** button.

**Speaker Delays**

11) With Input # 1 selected, go to the **DELAYS** submenu.

   a) If the center speaker is closer to the listening position than the front left and right speakers and cannot be brought to within the same distance of them, leave the front left and right delays at **0** and adjust the **CEN** (center) delay so that its sound arrives at the listener at the same time as the front left and right speakers. The delay value should be 1mS for each foot difference.

   b) If the center speaker is farther in distance from the listening position than the front left and right speaker, then set the **CEN** (center) delay to **0** and adjust the front left and right speaker delays so that their sound arrives at the listeners at the same time as the center speaker. The delay value should be 1mS for each foot difference. Please refer to the **Delays** section in this manual for additional details regarding the speaker delay feature and methods of calculating required speaker delay times.

   c) If the center speaker is equal distance from the listening position as the front left and right speaker, set the front left and right speaker and center speaker delays at **0**.

   d) Using the chart and method contained in the **Delays** section of the Owner's Manual, calculate the delay times for the left and right surround speakers.

   ![Diagram of speaker delays](image)

   **Speakers in a typical 5.1 system**

   e) Typically the center surround speaker (6.x surround system) is closer to the listening position than the surround left/right speakers. In this case, it must be delayed so that the sound from all of the surround speakers reaches the listener at the same time. Calculate the difference (distance in feet) between the center surround and one of the left/right surround speakers, to the listening position. Add this difference to the value already set for the left/right surround speakers and use this sum to set the delay value for the center surround speaker. (1 mS per foot of difference).

   f) Calculate the difference (distance in feet) between the left side and left front speakers. Add the difference to the default value already set for the left side to give this speaker its new value.

   g) Calculate the difference (distance in feet) between the right side and right front speakers. Add the difference to the default value already set for the right side to give this speaker its new value.

   h) Because of their low frequency properties, typically a delay in the subwoofer(s) is virtually undetectable. This being the case, it may be appropriate to leave the subwoofer delay values set at **0**. However, if any...
subwoofer is closer to the listening position than the front left/right speakers, a delay value can be set for these subs. The delay value will be the difference (in feet) between the sub itself and the front left or right speaker, to the listening position.

**Dolby Digital, DTS Setup**

The center and left/right surround speaker levels and delays can be different for Dolby Digital and DTS sources. There are separate **SETUP** submenus designed just for these modes. When the mode is Dolby Digital or DTS, the center and surround delays will work together with changes made in the above **DLYS** submenu. The values of the levels set in the Dolby Digital and DTS Setup submenus will be added to (or subtracted from) the level values in the **SETUP/INP/LVLs** submenu.

12)  
   a) Play a Dolby Digital 5.1 movie.  
      b) Go to the Dolby Digital setup submenu – page 2.  
      c) If desired, set the center speaker delay.  
      d) If desired, set the surround delay.  
      e) Set the center speaker level and the surround speaker level to 0. Please refer to the **SETUP/Dolby Digital** section in this manual for additional information regarding setting the Dolby Digital center and surround levels.  
      f) If no subwoofer exists in the system, a setting of 0 will route the LFE to the remaining 5 channels. Only if no LFE is desired should this setting be OFF. Setting the LFE at –10 [dB] may be desired for late night viewing or if source material may overpower the subwoofer. Setting the LFE to OFF may be useful for late night viewing, however, please note that any information in the .1 channel will be lost.  
      g) If the incoming signal is 5.1 and the Sides or Center Surround channels are being used, set the +SPKR value to the process which will be used to create the additional channels. This decision will be made solely by listening to which sounds best to the user.  
      h) Go to the Dolby Digital setup submenu – page 3.  
      i) If the incoming signal is EX flagged and the Sides or Center Surround channels are being used, set the +SPKR value to the process which will be used to create the additional channels. This decision will be made solely by listening to which sounds best to the user.  

Remember that these values will be in effect only when the **MODE** is Dolby Digital and specific flags are present.

13)  
   a) Play a DTS encoded CD or movie.  
   b) Go to the DTS page 1 Setup submenu.  
   c) If desired, set the center speaker delay.  
   d) If desired, set the surround delays.  
   e) Set the center speaker level.  
   f) Set each surround speaker.  
   g) Set the LFE level at 0 for DTS movies, or -10 for DTS music. (The user can choose to use two separate input select buttons, one for DTS movies and one for DTS music, all parameter values being the same except for the LFE setting).
h) If the incoming signal is 5.1 and the Sides or Center Surround channels are being used, set the +SPKR value to the process which will be used to create the additional channels. This decision will be made solely by listening to which sounds best to the user.

These parameter values apply only when the MODE is DTS.

Remaining Setup

14) Now that the speaker configuration, crossovers, levels and delays have been set up for input select button #1, they should be copied to all input select buttons as a good starting point. Do this in the MACROS submenu when input select # 1 is the current input.

15) Each input select button has a default mode assigned to it. The default mode for a given input select button is set and stored in the first SETUP/INPUT page. As the user scrolls through the list of modes, there are 2 positions in this list that are not currently used. In these positions, the word SKIP will be displayed.

a) Press input select button #1.
b) Go to the SETUP/INP – page 1 submenu.
c) Set the applicable default MODE.
d) Repeat steps b and c for each input select button.

16) An input signal is “processed” a certain way depending on which MODE is currently selected. It is possible to further process this signal for specific applications. (For details, refer to the Post Process section of this manual). If it is desired to further process the signal, continue with this step.

a) With Input # 1 selected, go to the Post Process submenu.
b) Select a Post Process.
c) Select Input # 2.
d) Go to the Post Process submenu.
e) Select a Post process.
f) Repeat steps c and d for each input select on which it is desired to have a Post Process.

17) The audio and video SOURCE pages allow the user to map up to six audio and 6 video input jacks to the currently selected input. It is recommended that all other displayed jacks in this submenu be cleared if they are not to be used. Please refer the Mapping Jacks and Search Order sections of this manual for additional details about mapping input jacks to a given Input Select button.

Verify that the desired rear panel audio and video input jacks are properly mapped to each Input Select button that is to be used.

a) Select input # 1.
b) Go to the AUDIO SOURCE submenu.
c) Map all appropriate rear panel audio input jacks.
d) Go to the VIDEO SOURCE submenu.
e) Map all appropriate video input jacks.
f) Select input # 2.
g) Repeat steps b through e for all used input select buttons.

18) All analog sources must have their input levels set in order to obtain the best signal to noise ratio as well as to ensure that no clipping occurs.

a) Go to the ANALOG LEVELS submenu.
b) Select the first set of jacks with an analog input jack assigned to it.
c) Adjust the analog input level.
d) Repeat steps b and c for each analog source.

Make adjustments so that during the most aggressive passages, the red clip light never comes on, but the –6 or –12 lights are on.
Flowchart A – Setup Subwoofer(s)

1. Go to Sub Config. menu
2a. Have Subwoofer(s)?
   - Yes: Set #SUBS to # of Sub Output Channels Used
   - No: Set #SUBS to 0
   - If 2 subwoofers in system, determine whether they are front left/right or front/rear
3. Subwoofer has internal crossover?
   - No: Repeat for each SUB in System
   - Yes: Is the subwoofer’s internal crossover defeatable?
     - No: Set Sub to FULL
     - Yes: Defeat (bypass) internal crossover in subwoofer
4. Set Sub to XOVER
5. Go to next page
Flowchart C – Front Center Configuration

1. Go to CEN Config sub menu
   - Step 6a

2. Center speaker exist?
   - Step 4
     - N: Set CFG to PHTM
       - Step 4a
     - Y: Center speaker to be crossed over?
       - Step 8b
         - N: Set CFG to FULL
           - Step 8e
         - Y:

3. Set CFG to XOVER, FULL/HP or XOVERLR
   - Step 8c & d

4. Go to Center Phase Perfect Submenu
   - Set Phase Perfect xover frequency
     - Step 8f

5. Set Phase Perfect xover slope
   - Step 8g

6. Set Phase Perfect Low Pass phase
   - Step 8h

7. Go to CEN Linkwitz-Riley Submenu
   - Set Linkwitz-Riley xover frequency
     - Step 8i

8. Set Linkwitz-Riley slope
   - Step 8i

9. Set Linkwitz-Riley Low Pass phase
   - Step 8i

10. Go to CEN Butterworth Submenu
    - Set Butterworth xover HI frequency
      - Step 8i

11. Set Butterworth xover HI slope
    - Step 8i

12. Go to CEN Butterworth xover LO frequency
    - Step 8i

13. Set Butterworth Low Pass phase
    - Step 8i

14. Set Butterworth xover LO slope
    - Step 8i

15. Set XOVER TYPE for Center Speaker
    - Step 8j

16. Route CEN LOP (Low pass) to SUB or LT/RT
    - Step 9

17. Go to next page
Flowchart E – Surround Center Configuration

- Go to CEN SUR Config sub menu
  - Step 8a

- Center Surround speaker exists?
  - Step 4
  - N
    - Set CFG to FULL
      - Step 8e
    - Y
      - Center Surround speaker to be crossed over?
        - Step 8b
        - N
          - Set CFG to OFF
            - Step 4a
        - Y
          - Set CFG to XOVER or FUL/LP
            - Step 8c & d

- Go to Center Surround Phase Perfect Submenu
  - Set Phase Perfect xover frequency
    - Step 8f

- Set Phase Perfect xover slope
  - Step 8g

- Set Phase Perfect Low Pass phase
  - Step 8h

- Go to SUR CEN Linkwitz-Riley Submenu
  - Set Linkwitz-Riley xover frequency
    - Step 8i

- Set Linkwitz-Riley slope
  - Step 8i

- Go to SUR CEN Butterworth Submenu
  - Set Butterworth xover HI frequency
    - Step 8i

- Set Butterworth xover HI slope
  - Step 8i

- Set Butterworth xover LO frequency
  - Step 8i

- Set Butterworth xover LO slope
  - Step 9i

- Set Butterworth Low Pass phase
  - Step 8i

- Set Center Surround XOVER TYPE
  - Step 8j

- Go to next step

Flowchart F – Surround (Back) Configuration

Go to Surround (Back) Config
Step 8a

Back Speakers exist?
Step 4

If Back speakers Are in system
Set Surrounds ON

Set Surrounds Off
Step 4a

End of Speaker Configuration setup
Flowchart G – Setup Speaker Levels

Go to the LEVELS submenu
Step 10

Point SPL meter ("C" weighted) at ceiling in main listening position, set reference level, adjust MASTER volume to measure 75 dB on SPL meter.

Activate noise in Front Left speaker
Step 10a

Hold SPL meter near left ear, pointed to ceiling. Adjust L3 speaker level to read 75dB on meter.
Step 10e

Activate noise in right (side) surround speaker.

Hold meter near right ear, pointed to ceiling. Adjust RS speaker level to read 75dB on meter.
Step 10f

Point SPL meter from main listening position. Adjust SC speaker level to read 75dB on SPL Meter.
Step 10k

Activate noise in center surround speaker
Step 10d

IF IN SYSTEM:
Activate noise in left (back) surround speaker.
Step 10g

Hold SPL meter near left ear pointed at the ceiling. Adjust left (back) surround speaker level to 75dB on SPL Meter.
Step 10h

IF IN SYSTEM:
Activate noise in right (back) surround speaker.
Step 10i

Hold meter near face pointed at the ceiling. Adjust SUB 1 speaker level to read 75dB on SPL meter
Step 10j

Activate noise in sub woofer (SUB1 if more than one SUB output exists and is being used)
Step 10m

Repeat above 2 steps for each sub in system, if any
Step 10n

Deactivate noise generator
Step 10o

Adjust right SPEAKER level to read 75dB on SPL meter
Step 10c

Hold SPL meter near left ear, pointed to ceiling. Adjust left (back) surround speaker level to 75dB on SPL meter.
Step 10g

Activate noise in center speaker
Step 10d

Adjust CEN speaker level to read 75dB on SPL meter
Step 10d
Flowchart H – Setup Speaker Delays

Go to the DELAYS submenu
Step 11

Is center speaker closer to listener than front LT/RT?
Step 11a

Y

Leave front LT/RT delays at 0, adjust center delay as per Delay section in owner’s manual
Step 11a

N

Is center speaker further from listener than front LT/RT?
Step 11b

Y

Leave center delay at 0, adjust front LT and RT delays as per Delay section in owner’s manual
Step 11b

N

Set front LT/RT and CEN delays at 0 (distance to listener of all 3 is equal)
Step 11c

Calculate and adjust LS delay as per Delay section in owner’s manual
Step 11d

Calculate and adjust right side delay as per the Delay section in owner’s manual
Step 11g

Calculate and adjust Sub 4 delay as per the Delay section in owner’s manual
Step 11h

Calculate and adjust RS delay as per Delay section in owner’s manual
Step 11d

Calculate and adjust Sub 1 delay as per the Delay section in owner’s manual
Step 11g

Calculate and adjust Sub 5 delay as per the Delay section in owner’s manual
Step 11h

Calculate and adjust surround center delay as per Delay section in owner’s manual
Step 11e

Calculate and adjust Sub 2 delay as per the Delay section in owner’s manual
Step 11h

Calculate and adjust Sub 3 delay as per the Delay section in owner’s manual
Step 11h

Calculate and adjust left side delay as per the Delay section in owner’s manual
Step 11f
Flowchart I – Setup Dolby Digital

Flowchart M – Setup Post Process

1. Select Input # 1
   - Step 17a
2. Go to Post Process submenu
   - Step 17a
3. If desired, Set Post Process
   - Step 17b
4. Select Input # 2
   - Step 17c
5. Go to Post Process submenu
   - Step 17d
6. If desired, Set Post Process
   - Step 17e
7. Repeat for all desired inputs
   - Step 17f
Flowchart N – Map Input Jacks

Select Input # 1
Step 18a

Go to SOURCE submenu
Step 18b

Assign audio input jack(s) to current input
(Refer to sections on Search Order and mapping Jacks in Owner's Manual)
Step 18c

Select Input # 2
Step 18d

Repeat all steps
Step 18e
Flowchart O – Setup Analog Input Levels

Go to Analog Levels submenu
(Setup/Global/Analog Levels)
Step 19a

Select input with analog signal
Step 19b

Adjust input level to just below clipping on loudest passage
Step 19c

Repeat for all inputs with analog source
Step 19d
FRONT PANEL OPERATIONS

This section describes the functionality of each button on the Casablanca III HD’s front panel only. For remote functionality descriptions, please refer to the section entitled REMOTE CONTROL OPERATIONS later in this manual. Descriptions for front panel buttons/functionality not covered in this section can be found in the preceding FRONT PANEL LAYOUT section.

Input Select Menus

When the Casablanca III HD is first powered up via the MAIN POWER switch on the back panel, it will check all software and hardware. It is in the default standby mode as soon as the front panel MAIN POWER LED is lit. After pressing the MAIN button on the front panel, the front panel display will show the start-up routine and then the current INPUT SELECT page, shown in figure 12 below. As this menu appears, the MAIN LED turns off. This display will be on during normal operation and will change only when one of the function buttons (or the STATUS button) is pressed.

When the Casablanca III HD is put into standby, the front panel display will read CHECKING DISPLAY and then all pixels will be illuminated for approximately 10 seconds. This check prolongs the life of the display.

Changing Inputs and Input Select Pages

The INPUT NAMES shown in this figure are for example only and will most likely differ from the user’s setup. There are two INPUT SELECT pages, giving the user a total of 12 inputs. Buttons 1 through 6 are used to select a desired input, or audio/video source. The LED above the selected button will illuminate when pressed. When the Casablanca III HD exits standby mode, the last active INPUT SELECT will be selected.

Pressing the LEVEL LEFT or RIGHT buttons switches between the two INPUT SELECT pages.

* * *

Figure 12 - Front Panel Display of the current INPUT SELECT page

Pressing the LEVEL UP/DOWN buttons will adjust the master volume for all speakers. A temporary bar graph appears on the VFD as the master volume is being adjusted. This value ranges from 0 to 73, relative to maximum.

The current MODE is displayed in the upper left corner. The “Additional Speakers” setting as well as the post process selection is also displayed. The displayed mode can vary slightly, depending on what the input signal is and which speakers are active. For example, if a center surround speaker is present and activated when a Dolby Digital EX signal is playing, the mode may be displayed as “Dolby Digital EX” however if the Center Surround speaker in this example was not present or turned on, then the mode would be reflected as “Dolby Digital”. This is because EX is not applicable when the speakers are reflective of a 5.1 (or less) system.

Selecting Mapped Input Jacks for the Currently Selected Input

Pressing the A-D button will toggle between the input jacks that are mapped to this INPUT SELECT button. Please refer to page 4646 (Search Order) for important, detailed information regarding using the A-D button.
The **MUTE** button will toggle the audio between the master volume level and **MUTE** level* in all speakers each time it is pressed. When the mute feature is enabled, the word **LEVEL** in the VFD will be replaced with the word **MUTED**, which will remain displayed until the mute is disabled. The **MUTE** feature is active in all menus, at all times.

*Note: The factory default value for **MUTE** is 0, which is to say that when the **MUTE** button is pressed, the output level of all channels will be completely muted (master volume = 0). The Casablanca III HD offers a feature in the **SETUP/GLOBAL/MUTE-VOLUME** submenu whereby when the **MUTE** button is pressed, the Casablanca III HD will mute to a user defined master volume level. Please refer to page 78 for additional information regarding this feature.

The Casablanca III HD can be un-muted in two ways: pressing either the **MUTE** button or the **LEVEL UP/DOWN** buttons. Please refer to page 78 for additional information regarding this feature.

The **DISPLAY** button will toggle the front panel VFD brightness between off, ¼, ½, ¾ and full brightness. When the VFD is turned off, the red logo LEDs also turn off.

This change will be temporary and will hold only until another action is taken. To permanently set the VFD brightness, by INPUT SELECT button, go to **SET-UP/INP/VFD**.
Search Order

The Casablanca III HD’s inputs can support virtually every analog and digital and video format used in today’s technology. Up to 6 audio input jacks can be mapped to each **INPUT SELECT** button. These 6 input jacks can be all digital, all analog or any combination of both. In the **SETUP/INP Page 2/SOURCE/AUD** page, the order in which they are mapped to a given **INPUT SELECT** button determines the order each is displayed when the A-D button is pressed when in the **INPUT SELECT** menu. This is called **Input Search Order**. Figure 13 below shows **INPUT SELECT 1** having the CD and DVD input jacks mapped to it, with the CD jack having the highest priority (being in the first position). In this example, there are no other physical input jacks required to be mapped to **INPUT SELECT 1**, therefore the jack name positions of 3-6 are blank. Pressing the A-D button while in the **INPUT SELECT** page, will toggle between the CD input jack and the DVD input jack. Pressing the A-D button in the **SETUP/INP Page 2/SOURCE/AUD** submenu will access the video search order page. In this page, pressing buttons 1-6 will allow the user to assign a video input jack (1-6) to correspond to the respective audio search order. In the above example, one would not assign a video jack to search order # 1 since the audio search order # 1 is assigned to CD, which is not a video source. If one wanted an unrelated video source to be viewable when listening to CDs, simply map a video source to video search order # 1. Also in the above example, one would normally assign the DVD video input to video search order # 2.

![Figure 13 - Front Panel Display of the SETUP/INP Page 2/SOURCE/AUD page](image)

*Caution*: Please take special care to insert only a digital signal into a digital input jack and an analog signal only into an analog input jack. Damage, not covered under warranty, can occur if an analog signal is applied to a digital input. Additionally, please ensure that a video plug is not inadvertently inserted into a digital audio jack and visa versa, otherwise, the Casablanca III HD will cease to respond.
MODE Function

Pressing the MODE button (shaded in figures 14, 15 and 16) once displays the first page of the MODE menu. This first page consists of 6 different signal ‘processing’ modes, one of which can be selected and temporarily applied to the currently selected input signal, when applicable. A right arrow is displayed in the lower right corner of the VFD indicating that there is an additional MODE page. Pressing the A-D button once will reveal the second page, all consisting of additional modes. Figure 14 shows the first MODE page, and figure 15 shows the second.

Note: This menu allows the user to audition different modes when possible. It does not store the changed mode. When a different INPUT SELECT button is pressed, or the Casablanca III HD is powered down, the MODE will revert to its default for that INPUT SELECT button. Each INPUT SELECT button can have its own default MODE, the default mode for each INPUT SELECT is set in the SETUP/INPUT menu. Please refer to page 63 (Default Mode) for information on setting the MODE for an INPUT SELECT button.

Figure 14 - Front Panel Display of the MODE Page 1 Menu

Press button 1 - 6 to select the desired mode. The corresponding LED above buttons 1 through 6 will illuminate.

Each of the 6 modes shown in figure 14 are described below:

Pro Logic IIx outputs 5.1, 6.1 or 7.1 channels from 2-channel or 5.1 channel sources, incorporating the best elements of Dolby Digital, Dolby Digital EX and Dolby Pro Logic II.

Dolby Pro Logic IIx Movie (MOVIE). Intended to be used with 2-channel TV sources and will create 5.1, 6.1 or 7.1 output channels. Movie mode is the reference decoder mode for any such surround-encoded program.

Dolby Pro Logic IIx Music (MUSIC). The Music mode is for use with stereo recordings and provides a wide and deep sound space. The Music mode balances the multi-channel surround sound field to content that was not specifically encoded for surround playback. The Music Mode includes controls that allow additional sound tailoring. These include Center Width and Panorama Mode, which are both discussed in the Setup Dolby Digital section of this manual.

Dolby Pro Logic IIx Matrix (MMATX). This mode is intended to enhance incoming an mono signal or make a poor incoming FM signal more listenable by forcing it into mono.

DTS Neo:6 was designed to provide a richer and more natural surround sound experience from 2-channel sources. It outputs 5.1, 6.1 or 7.1 channels. An incoming Neo:6 signal can be encoded as either Matrix or Discrete.

DTS Neo:6 Cinema (CINE). This is intended to be used with a 5.1 or 6.1 channel source and will output 5.1, 6.1 or 7.1 channels.
DTS Neo:6 Music (MUSIC). This mode will take an incoming 2-channel source and output 5.1, 6.1 or 7.1 channels. It is intended to be used with any 2-channel source. It preserves the integrity of a stereo mix while augmenting it with a center to anchor the image, and derive enough sound content to yield a spacious, three dimensional listening experience. Music Mode includes a user adjustable variable called CGAIN, or Center Gain. This is discussed in the SETUP|DTS section of this manual.

STEREO: Left and Right input signals are sent to the Left and Right front speakers. If crossed over in the SETUP\SPKR\CONFIG menu, SUB channel(s) will be produced.

Press the A-D button to navigate to the second page of the MODE menu.

**Figure 15 - Front Panel Display of the MODE Page 2 Menu**

Matrix (MATX): The signal routed to the center speaker is equal to the left plus right input signals and the mono signal routed to the surround speakers is equal to left minus right signals. Crossing over any speaker(s) produces sub channel(s).

Special Matrix (SPCL MATX): A mode similar to Dolby Pro Logic with more ambience retrieval in the surround speakers. Crossing over any speaker(s) produces a sub channel.

MONO: This mode routes the input signal to the center channel only, however, if the center channel is crossed over, a sub channel will be produced. If the center channel is set to OFF or PHANTM in the SETUP/INPUT/CONFIG submenu, the input signal will be routed to the front left and right speakers.

Analog Direct (ANLG DRCT): This mode takes the selected analog input and routes it directly to the main Left/Right output volume controls. Since there is no surround processing in Analog Direct, the sub woofer, EQ, phantom center channel, and crossover effects are not available. Note: If these effects are desired, use the STEREO mode. The Analog Direct mode will route only an analog signal to the outputs.

Analog Matrix (ANLG MATX): The signal routing in this mode is the same as Analog Direct (ANLG DRCT), (left & right analog input signals routed directly to the main outputs via the volume controls), and at the same time the input left and right signals are routed through an analog to digital converter and matrixed in order to derive the other channels, which include left & right surround, sides, center and center surround. These other channels can have EQ and be crossed over (creating a SUB channel), but the front left and right channels will carry only the direct analog signal. The Analog Matrix mode processes a 2-channel analog input signal only.

---

* * *
The current Mode is always shown on the top left of the main Input Select menu. If the incoming signal contains an identifying flag, a bit of information contained in the incoming digital data stream, the Casablanca will automatically switch to that mode. An example of this would be Dolby TrueHD, DTS-HD Master Audio, DTS Discrete, Dolby EX, DTS Matrix, DTS ES, DTS 96/24, etc.

These modes are not selectable by the user since they are intended for use only when that signal type is detected.

* * *

If the Casablanca III HD detects a flagged Dolby Digital signal on the selected digital input jack, and the MODE is not set to DOLBY DIGITAL, the Casablanca III HD will display the following message on both the VFD:

**RECEIVING DOLBY DIGITAL SIGNAL**
CHANGING MODE TO DOLBY DIGITAL

and display one of the DOLBY DIGITAL modes as the current mode. Approximately 2 seconds after the Casablanca III HD ceases to receive this signal (no lock), the MODE will revert back to the default mode for that Input Select button. If the detected signal's format is Dolby Digital 2.0, the same auto detecting message will appear for a few seconds and the display will show DOLBY DIGITAL+ PRO LOGIC as the mode. Please refer to page 79 to turn on or off the Mode Change message.

If the Casablanca III HD detects a flagged DTS signal on the selected digital input jack, and the MODE is not set to DTS, the Casablanca III HD will display the following message on both the VFD:

**RECEIVING DTS SIGNAL**
CHANGING MODE TO DTS

and display one of the DTS modes as the current mode. Approximately 2 seconds after the Casablanca III HD ceases to receive this signal (no lock), the MODE will revert back to the default mode. Please refer to page 70 for additional DTS setup options, selectable in the second page of the SETUP/INPUT submenu.

Note: The "auto-detecting" messages for Dolby Digital and DTS will not show, by default. There is a parameter in the SETUP/GLOBAL page 2 submenu (page 79) that turns this feature on and off.

* * *

After selecting a temporary mode for the current input channel, pressing the MODE button once more returns the Casablanca III HD to the INPUT SELECT menu. While in the MODE menu, the MASTER VOLUME can be controlled using the LEVEL UP/DOWN buttons.

Note: If the default MODE is DOLBY DIGITAL or DTS and a non-flagged 96K signal is received, the Casablanca III HD will momentarily display a message (if the MSG parameter is set to ON) indicating that it is receiving a 96K signal and [temporarily] changing the current mode to STEREO. The user can change this mode, after it has been changed to STEREO, by using the front panel MODE button and selecting a different and applicable MODE. The user cannot change which MODE the Casablanca III HD initially changes to when receiving a 96K signal if the default MODE for the currently selected input is either DOLBY DIGITAL or DTS.
TAPE OUT Function

This feature simultaneously controls the routing of signals to the analog audio, digital audio and the video tape out jacks.

Pressing the TAPE OUT button once changes the VFD display to the TAPE OUT menu shown in figure 16.

Note: The jack names shown in this figure are for example only and will most likely differ from the user’s setup.

![Figure 16 - Front Panel Display of the TAPE OUT Menu](image)

In this menu, pressing button # 1 allows the user to route any audio input jack - analog or digital - to the analog TAPE OUT jacks. (Audio from an HDMI input is not available.) This menu is completely dynamic. When the audio source is from an analog jack, the digital tape out jacks are disabled. This is indicated on the VFD. Digital input sources will be routed to both the Analog Tape Out jacks and the Digital Tape Out jacks. Analog sources will be routed only to the Analog Tape Out jacks, disabling the Digital Tape outs. This is confirmed in the lower right corner of the VFD by the indication “DIGI OFF” when an analog source is selected.

When the MAIN DACs are selected (default), this is indicated on the VFD. If the optional tape out DAC is not installed, the option to select it (via button # 5) is not shown.

Button # 5 allows the user to select whether the signal at the analog TAPE OUT jacks is derived from the main output DACs or the optional tape out DAC, (if installed), by displaying MAIN or TAPE above button # 5. The TAPE setting is only relevant if a digital source is being routed to the analog tape out. All analog inputs are routed directly to the TAPE OUT jacks, without A/D to D/A conversion.

The ANALOG and DIGITAL sources can be set to INPUT. With this setting, the tape out sources will ‘follow’ whichever input the user has currently selected. When the user changes inputs, the tape out source simultaneously changes to the currently active input jacks.

When the routing is completed, press TAPE OUT again to clear the video display. While in these menus, the MASTER VOLUME can be controlled via the LEVEL LEFT/RIGHT buttons.

**CAUTION:** It is not advisable to route a decoded multi-channel source (DTS/Dolby Digital) to the optional tape out DAC as this section does not contain Dolby Digital or DTS decoding capabilities. Full scale and potentially damaging noise will be output! HDMI signals cannot be routed to this output.
**Standard Tape Out Configuration**

The following guidelines apply when the tape out circuitry is in its standard configuration, i.e. the optional tape out D/A converter has not been installed.

A source to be recorded (via the analog TAPE OUT jacks) can be selected independently of the source currently being viewed or listened to provided that the input for the source to be recorded is ANALOG.

It is possible to record a digital source in analog, only if the source is the same as the input being watched or listened to (or the source that is currently selected). If the desired source is multi-channel (DTS/Dolby Digital), it is recommended that both the surrounds and center speakers be set to phantom (PHTM). This mixes those channels’ information into the front left/right channels to ensure that all channels of information are heard.

**Optional Upgrade Tape Out Configuration**

When the optional D/A converter has been installed onto the Digital Input board, one digital source can be recorded, i.e. sent to the analog TAPE OUT jacks, at the same time as a second digital source is being listened to on the main outputs.

**Note:** Signals received from the HDMI JACKS are not available at the TAPE OUT jacks.
**SETUP Function**

This function provides access to a series of submenus that will allow the configuration of the entire system. In this section, each feature of the SETUP menu is discussed in detail along with a diagram of each VFD display.

**Note:** A complete step-by-step speaker configuration setup guide is located on page 22.

Pressing the SET-UP button once changes the front panel display to the first page of the SETUP menu, shown in figure 17.

![Figure 17 - Front Panel Display of the SETUP Menu](image)

As indicated in figure 18, button 1 is assigned to features that are stored by input and leads to submenus on 3 s. Button # 2 accesses all submenus and parameters that are global (not programmable to each INPUT SELECT). Button # 3 accesses the MACROS submenu and button # 4 allows the user to password protect all SETUP features. Button # 5 displays the configuration of the installed DAC cards.

**Setup Button Password**

It is possible to password protect the entire SETUP function, or have no password at all. If a password is set here, the user will be asked to enter the 5 digit password whenever the SETUP button is pressed. To set a password for the SET-UP button press button # 4. The user will be asked “ARE YOU SURE YOU WANT TO ENTER A PASSWORD FOR THIS MENU?” Choosing “YES” (the A-D button) will display the following page:

![Figure 18 - Front Panel Display of the SETUP/Assign Password Display](image)

Use buttons 1-6 to assign a password. If no password is to be used (factory default), press the A-D button five times, entering all zeros. All zeros, or a zero anywhere in the password negates the password.

**CAUTION:** It is imperative that all passwords be written down. If forgotten, **ALL** access to the SETUP menu will be denied. Please see the **WARNING** on page 19.

**DAC Configuration**

Pressing button # 5 allows the user to view the channels assigned to each DAC card. This is an information page only and may not be edited. As an example, the first page will say “LEFT FRONT CEN” if a three-channel Standard or Superior balanced DAC card is in DAC slot # 1. Press the A-D button to view the channels assigned to the second DAC card. Press the A-D once more for the third DAC card, if installed. Press SET-UP once to exit this menu.

The following section will discuss all menus and parameters under the INPUT button.
SETUP INPUT (Settings specific to each of the 12 Input Select Buttons)

Setup Input Page 1

All parameters accessed within the SETUP/INP menu are separately programmable for each of the 12 INPUT SELECT buttons.

From the SETUP menu press button # 1 (INP). The first of three pages of the SETUP/INPUT submenus will appear, as shown in figure 19.

![Figure 19 - Front Panel Display of the SETUP/INPUT page 1 Submenu](image)

Pressing button # 1 takes the user into a series of submenus that allow the configuration of all speakers. Button # 2 allows the user to set the speaker levels and button # 3 allows the user to set speaker delays.

Press button # 4 and use the LEVEL UP/DOWN buttons to set the default MODE for the currently selected INPUT SELECT button.

Button # 6 provides a means of setting the VFD brightness for the currently selected INPUT SELECT button.

Pressing the A-D button takes the user to page 2 of SETUP/INP.

Setup Speaker Configuration

The Speaker Configuration section utilizes the menus shown in figure 20.

![Figure 20 - Menu Map of SETUP/INP Page 1/CONFIG](image)

The configuration submenus (CONFIG) allow the user to configure the Casablanca III HD to reflect the audio system configuration or the listener’s preference for the available speakers and their respective frequency responses.
All speaker configuration parameters are accessed by pressing button # 1 (CONFIG). This leads to a series of submenus. The first submenu, SPEAKER CONFIG is shown below, in figure 21.

![Figure 21 - Front Panel Display of the Speaker Configuration Submenu](image)

As indicated in figure 21 above, the front left/right speaker configuration is accessed by pressing button # 1, the center via button # 2, the left/right surrounds with button # 3, # 4 is for the sub woofer(s), # 5 for the center surround and # 6 allows the user to turn the side speakers, if any, ON or OFF. Before configuring any speakers in the system, it is important to configure the sub woofer. First, determine whether or not a sub or subs are required or desired. Press button # 4 to go to the SUB CONFIG submenu, shown in figure 22, and set up the sub(s). If no sub(s) is present, or is not desired, set the number of subs (#SUBS) to 0 and disregard any crossover types at this time. Lastly, configure the other speakers in the system via buttons 1-3 and 5-6.

**Note:** Information for the side channels is the same as the left/right surrounds. Therefore the configuration setting for the surrounds also applies to the sides. Level and delay settings can be applied separately for the sides via the Levels and Delays submenus, respectively.

**SUB Configuration**

**Note:** If the source does not contain a discrete LFE channel, no signal will be routed to the SUB output(s) unless one or more speakers are crossed over. If the source contains a discrete LFE channel and the #SUBS is turned off (set to 0), the LFE signal will be routed equally to all speakers whose CFG is set to FULL.

![Figure 22 - Front Panel Display of the Subs Configuration Submenu](image)

Unlike most configuration submenus in the Casablanca III HD, this one is not dynamic. In other words, if there are 1-5 DAC channels installed that are configured as sub woofers, this submenu will show, and allow configuration editing for all 5, except for the #SUBS parameter. In this case, should a Casablanca III HD be installed with only one sub channel, this value will allow only one or zero, etc.

If the number of Subs (#SUBS) is set to 1, all low-pass portion of all crossed over speakers and the full LFE are routed to the SUB 1 output. (Labeled SUB if there is only one sub output, LEFT FRONT SUB or SUB1 if there is more than one sub output). If the number of SUBS is set to more than 1, any low pass signals and LFE will be routed as follows:

If the #SUBS is set to 2 they can be either L-R or F-R. If set to L-R (Front Left/Right), any LFE and the low pass portion of any front speakers that are crossed over will be routed to the front left/right sub woofers. (The LFE is divided by 2, added to any low pass information and distributed evenly between them). If the #SUBS is set to F-R (2 subs – 1 front and 1 rear), each sub will get half of the LFE. The low pass portion of any front speakers that are crossed over will be routed to the front sub whereas the low pass portion of any surround speakers will be routed to
If the #SUBS is 3, the low pass portion of the front speakers that are crossed over will be routed to the 2 front subs and the low pass from the surround speakers that are crossed over will be routed to the rear sub. LFE will be divided by 3 and routed equally between the 3 subs, added to any low pass signal. If there are more than 3 DAC channels assigned to subs yet the #SUBS is set to 3, the third, or rear sub will be output from the channel marked SUB 3 or LEFT SURROUND SUB. When the #SUBS is set to 3, the first 2 will always be the FRONT LEFT and FRONT RIGHT subs and the third will always be used for low pass signals from the surround speakers, plus some LFE.

If the #SUBS 4, each sub will get ¼ of the LFE. Additionally, the low pass signal from any front speakers that are crossed over will be routed to the front subs (SUB 1 and SUB 2) and the low pass signal from any surround speakers that are crossed over will be routed to the surround subs (SUB 3 and SUB 4). In this case, Sub1 = Left Front Sub, Sub2 = Right Front Sub, Sub3 = Left Surround sub and Sub4 = Right Surround Sub.

If the #SUBS is 5, each sub will get 1/5 of the LFE. The low pass signal from the front left/right speakers, if crossed over, will be routed to the front left and right subs. If the center speaker is crossed over, its low pass signal will be routed to the SUB5 output. The low pass signal from any surround speakers that are crossed over will be routed to the left/right surround subs.

If subs are present in the system, verify that the #SUBS is set to equal the number of sub woofers being used (button #1 in figure 22), and determine if each one needs to be sent a crossed over or a full range signal. (FULL or XOVER in the VFD. FULL is only required if the subwoofer contains its own crossover that cannot be defeated. If that is the case, it is recommended that the subwoofer manufacturer be contacted to see if there is a possible modification to the subwoofer to defeat its crossover. The crossovers in the Casablanca III HD have been engineered to be superior to any analog crossover, regardless of quality.

**Left/Right Speaker Configuration**

The left/right configuration section contains the submenus shown in figure 23.

---

**Figure 23 - Menu Map of SETUP/INP Page 1/CONFIG/LT/RT**

Before proceeding to configure and cross over speakers, it is important to better understand the 3 types of crossovers in order to select the most appropriate crossover type, crossover points and slopes. A discussion about crossovers follows.

A discussion of crossovers commences on page 22.
Crossovers

The Casablanca III HD contains a comprehensive set of speaker configuration settings. These settings are believed to be the most complete ever offered in a home theater component and should allow any speaker to perform optimally regardless of speaker type. It is important to bear in mind that the below procedure is merely a guideline and that room acoustics, speaker design/quality, music/movie type, and personal preference all play a part in these settings.

Each full speaker configuration is stored separately for each INPUT SELECT button. In SETUP/INP Page 1, press button #1 (labeled CONFIG on the VFD to access the speaker configuration menu.

In the speaker configuration submenu, pressing buttons 1-5 will access additional menus to setup each set of speakers. For each speaker set there are three settings for the crossover type: "Phase Perfect", "Butterworth", and "Linkwitz-Riley". It is possible to select one crossover type for the front left/right speakers, a different one for the center and a third type for the surrounds. It is recommended that in the beginning, the same type be used for all until it is time to fine tune. To help the user better understand the sonic consequences and individual advantages, please refer to the 5 headings of the Step-By-Step Setup guide on page 21.

Press button #1 to set up the front left/right speakers. This configuration submenu is shown in figure 24.

Figure 24 - Front Panel Display of the Front Left/Right Speaker Configuration Submenu

Pressing button #1 allows the configuration of the front left/right speakers. If these speakers are not to be crossed over (a portion of their signal sent to the SUB output(s)), then the setting should be FULL.

FULL/LP is a crossover option which sends the full left/right channel information to the front left/right speakers and duplicates the low pass portion in the subwoofer(s). If FULL/LP is selected, a crossover type must be selected (button #5), and the appropriate crossover frequencies and slopes set up using buttons 2-4.

Note: If the crossover type is Phase Perfect (φPERF) and the CFG type is set to FULL/LP, no low pass signal will be created. This is a unique limitation of the Phase Perfect crossover type.

Should it be desired to crossover the front left/right speakers, the CFG setting (button #1) should be set to XOVER and the crossover frequencies and slopes in the Phase Perfect (φPERF), Linkwitz-Riley (LINK-RILEY) and Butterworth (BWORTH) submenus be set using buttons 2, 3 and 4 respectively.

Note: It is advisable to select the same crossover frequencies and slopes in all 3 crossover type submenus (buttons 2-4), and then toggle the crossover TYPE (button #5) and audition each crossover. Initially, this should be done with all other speakers turned off. This procedure should be applied when configuring each speaker set.

Set up the crossovers as follows. Press button #2 (φPERF). This submenu is shown in figure 25.

Figure 25 - Front Panel Display of the SETUP/INP/CONFIG/LT/RT/φPERF Submenu
Press button # 1 and select a Phase Perfect crossover frequency for the front left/right speakers, then button # 2 to set the high pass slope.

Button # 3 allows the user to invert the low pass phase from 0 (+) to 180 degrees out of phase.

Table 3 - Available configuration settings for front L/R speaker Linkwitz-Riley crossover.

Press SETUP once to return to the front left/right configuration submenu, then press button # 4 (BWORTH) to set up the Butterworth crossovers. This submenu is shown in figure 27.

Figure 27 - Front Panel Display of the SETUP/INP/CONFIG/LT/RT/BWORTH Submenu

Press button # 1 and select a Butterworth high pass crossover frequency, then button # 2 to set the high pass slope. Press button # 3 to set the low pass crossover frequency, then button # 4 to set the low pass slope. Generally speaking, the high and low pass crossover frequencies should be the same unless compensating for unique room or speaker characteristics. Button # 5 allows the user to invert the low pass phase from 0 (+) to 180 (-) degrees out of phase.
Table 4 - Available configuration settings for front L/R speaker Butterworth crossover.

Press SETUP twice to return to the speaker configuration submenu, then press button # 2 (CEN) to set up the center speaker. This submenu is shown in figure 28.

**Center Speaker Configuration**

![Figure 28 - Front Panel Display of the SETUP/INP/CONFIG/CENTER Submenu](image)

This submenu of settings for the Center speaker is virtually the same as the one for the front left/right speakers, with two additional options. When the CFG setting is set to XOVER or FUL/LP, the low pass signal from the crossed over center will be routed to the sub, if one sub exists, or front left/right subs if there are 2 in the front. This same low pass signal can alternately be routed to the front left/right speakers if the CFG setting is XOVRLR. If the center low pass signal is routed to the front left/right speakers, and these front speakers are crossed over, the low pass signal from the center stays routed to the front left/right speakers and the low pass signal from the front left/right will then be routed to the subs. If the #SUBS is set to 0 and the front left/right CFG is set to XOVER, the low pass signal of the front left/right will be lost.

Routing the center low pass to the front left/right speakers can be useful with center speakers that have a limited bass response (-3dB @ 100Hz). In this case, the recommended crossover frequency should be set to 160Hz.

If no center speaker is present in the system, the CFG parameter should be set to PHANTM (phantom). With this setting, the center channel signal is routed to the front left/right speakers. When the center CFG is set to PHANTM, the user has the ability to adjust the level of the center channel in the front left/right speakers. This can be accomplished via button # 6 – PHLVL (phantom level).

**Note:** The phantom (PHTM) setting for the center speaker creates the illusion of having a center speaker when the listener is positioned equidistant from the front left and right speakers. There is, however, no substitute for a real center speaker as it creates a solid center image even when the listener is positioned off-axis. The phantom setting is most useful on video sources where a more prominent center image is desirable and no center speaker is present. On music sources, OFF may be the preferred setting as it maintains the imaging properties of the original source.

Pressing button # 1 allows the configuration of the center speaker. If this speaker is not to be crossed over, then the CFG should be set to FULL. There is an option where the full range signal can be routed to the center speaker with the low pass part of it also routed to the sub (FUL/LP) or the high pass signal going to the center and its crossed over low pass portion being routed to the front left/right speakers as discussed above (XOVRLR). Whenever any speaker is crossed over, a crossover type must be selected, and the appropriate crossover frequencies and slopes set.

The center speaker can also be set to XOVER or OFF. In the case of OFF, any center channel information will be lost.

Press button # 2, 3 and 4 to set the crossover settings for the center speaker in the same manner as with the front left/right. The crossover menus are the same, with the exception of the speaker name in the upper right corner of the
Pressing button # 5 allows the user to select the crossover type that will be applied to the center speaker.

Button # 6 allows the user to adjust the level of center channel information that is routed to the front left/right channels, if the **CONFIG** parameter is set to **PHANTOM**.

If there are 5 subwoofers in the system, low pass signal from the center speaker will be routed only to the #5 sub. In other words, Sub5 is dedicated to the front center speaker.

**Note:** A Casablanca III HD can have a Sub5 or a Surround Center channel.

Press **SETUP** to return to the speaker configuration submenu, then press button # 3 (**L-R SURRND**) to set up the surround speakers. This submenu is shown in figure 29.

**Left/Right Surround Speaker Configuration**

Set the speaker configuration and crossovers, if necessary, in the same manner as with the center speaker. Configuration choices are **FULL**, **FULL/LP**, **XOVER**, **PHANTM** and **OFF**. If the speakers are crossed over, Linkwitz-Riley, Butterworth and Phase Perfect with all crossover points and slope options available.

The phantom (**PHANTM**) setting for the surround speakers should be utilized if no surround speakers are present in the system. In this case, with 5.1 sources, the surround information is added to the front left/right channels. In Dolby Pro Logic mode, the Casablanca III HD will automatically decode in Dolby 3 stereo. When the left/right surrounds are set to **PHANTM**, the user can adjust their level using the **PHLVL** parameter.

**Center Surround Speaker Configuration**

Set the center surround speaker configuration and crossovers, if necessary, in the same manner as the left/right surround speakers. The submenu options are the same as L/R. If the center surround **CFG** is set to **PHANTM**, its information is routed to the surround left/right speakers. Use the **PHLVL** (phantom level) parameter to adjust the mix. If the Center Surround speaker is crossed over and there is a rear subwoofer(s), the low pass signal from the center surround will be routed to the rear sub woofer(s).

**Side Speaker Configuration**

The side speaker information is an exact replica of the left/right surround channels. In the speaker configuration menu, they can be turned on and off. Their levels and delays can be individually adjusted in the levels and delays submenus.
**Speaker Levels**

This submenu allows the user to set the relative level of each speaker in order to reflect the audio system speaker configuration, room characteristics, or the listener’s preference. The allowable relative range is -15dB to +15dB.

Like the speaker configuration menus, the level submenu(s) will reflect the DAC channels that are installed in the Casablanca III HD. If there are 6 DAC channels installed, the names of these channels will be displayed on one page of the levels submenu. If more than 6 DAC channels are installed, a menu will appear asking the user which set of speakers are to have their levels adjusted: 1-6 or 7-12, as shown in figure 30. In these submenus, the installed DAC channels, or speaker names, will be displayed.

**Figure 30 - Front Panel Display of the SETUP/INP/LVLS/Channel Choice Submenu**

From the Input Select menu, press SETUP, input (INP) then levels (LVLS) to access the speaker levels setup submenu shown in figure 31. If more than 6 DAC channels are installed, the user must press either button # 1 (1-6) or # 2 (7-12).

**Figure 31 - Front Panel Display of the SETUP/INP/LVLS 1-6 Submenu**

If there are more than 6 DAC channels installed, pressing button # 2 on the Levels Channel Choice submenu will produce a second levels submenu similar to the one shown in figure 32. The speaker names in this submenu will reflect the channels present in the user’s Casablanca III HD.

**Figure 32 - Front Panel Display of the SETUP/INP/LVLS 7-12 Submenu**

In these submenus, press button(s) 1-6 to select a speaker to edit. Use the LEVEL UP/DOWN buttons to adjust each speaker’s output level. Use the LEVEL LEFT/RIGHT buttons to adjust the master volume. If there is a level control on the sub itself, adjust that first and then fine-tune with the Casablanca III HD.

**Internal Noise Generator**

To aid in establishing a desired system speaker level balance, the Casablanca III HD provides the user with the option of routing the currently selected audio signal, an internally generated noise signal to all speakers simultaneously or to a selected speaker.

This function is accessed via the A-D button in the SETUP/INP/LVLS submenu(s). Press buttons 1-6 to select a speaker. Pressing the A-D button repeatedly toggles through these sources. Table 5 shows the 3 possible routings.
When the A-D button is pressed, the source name or noise type will appear in the VFD below the submenu title.

<table>
<thead>
<tr>
<th>Press A-D Button</th>

<td>Noise - one (selected) speaker</td>
<td>NOISE 1</td>
</tr>
</tbody>
</table>

Table 5 - Source to Output Routing for Speaker Level Configuration.

When use of the noise generator is complete, press A-D to once again re-route the SOURCE to the outputs.

Note: It is recommended that levels be set relative to the Front Left and Right speakers. First adjust the Front Left and Right level value(s) to zero dB. With the noise generator set to output to the left front speaker, adjust the master volume. The remaining speakers can be adjusted accordingly by pressing buttons 2-6 one at a time, then pressing LEVEL UP or LEVEL DOWN to increase or decrease each speaker’s relative level using an SPL meter, until the desired system balance is established. Please refer to the detailed Step-by-Step Setup Guide on page 20.
Speaker Delays

Like the Levels submenu(s), the Delays submenu(s) are interactive. Only installed DAC channels will appear in the Delays submenu. If there are two Delays submenus, the A-D button will toggle between them.

The Delays submenu allows the user to set a time delay for each speaker to reflect the audio system configuration, room characteristics, or the listener’s preference. The sound from all speakers should reach the listening position at the same time, and this submenu provides a means for achieving just that. The allowable range for the front left/right, center and sub speaker(s) is 0 to 10 milliseconds (mS) and 15 to 31 mS for the side and surround speakers. Since discrete sources are often recorded with surround delays, it is recommended that the surround delay setting for 5.1 sources be 15 mS less than non 5.1 sources.

![Figure 33 - Front Panel Display of the SETUP/INP/DELAYS 1 Submenu](image)

Press SETUP, input (INP) then delays (DLYS) to access the speaker delays setup submenu shown in figure 33. The current delay settings will be displayed on the top row of the VFD. The submenu title “DELAYS” will be displayed in the upper right corner. Delay settings apply to all MODES, however, they can be further manipulated when the MODE is Dolby Digital or DTS, via additional Setup submenus for these MODES. These additional Setup features and respective submenus are discussed further in this section.

The first time a multi-channel audio system is set up in a room, calibration of time delay [and speaker levels] is required in order to have the sound from each individual speaker reach the listener at the correct time.

If more than six DAC channels are installed in the Casablanca III HD, there will be a right arrow above the A-D button. Press this button, and the second Delay page will be presented as shown in figure 34.

![Figure 34 - Front Panel Display of the SETUP/INP/DELAYS 2 Submenu](image)

Speaker delay is required if a speaker is closer to the listening position than the front left and right speakers. When this is the case, the delay time should be 1mS for each foot difference.

Begin by measuring the distance (in feet) from each speaker to the listening position. Write down all of these values. Ideally, the front left/right and center speakers will all be the same distance to the listening position. In this case, set the front left/right and center speaker delays to 0mS. If the center speaker is closer, delay it 1mS for each foot of difference between the center and front left/right, to the listening position. If the front left/right speakers are closer than the center, then set the center delay at 0 and delay the front left/right speakers, again, 1mS for each foot of difference from the listening position.
To determine a delay time for the surround left/right speakers, measure the distance (in feet) from the listening position to the front left/right, then from the listening position to the surround left and right speakers. Subtract the front left and surround left distance from the front right and the surround right distance. Add this number to the existing delay value of the surround left/right speakers. (1 mS/foot). The chart in figure 35 can also be used to calculate the surround left/right delay values.

Figure 35 - Rear Delay Settings

For the surround center delay, take the difference (in feet) between the center surround speaker and the listening position and the surround left or right to the listening position. Add this value to the existing [default] surround center delay value (1ms per foot of difference).

To set the side speaker delays, calculate the difference (distance in feet) between the left side and left front speakers. Add the difference to the default value already set for the left side to give this speaker its new value.

Calculate the difference (distance in feet) between the right side and right front speakers. Add the difference to the default value already set for the right side to give this speaker its new value.

Because of the properties of low frequencies, a delay in the subwoofer(s) is virtually undetectable. This being the case, it may be appropriate to leave the subwoofer delay values set at 0. However, if any subwoofer is closer to the listening position than the front left/right speakers, a delay value can be set for these subs. The delay value will be the difference (in feet) between the sub itself and the front left or right speaker, to the listening position.

Default Mode

Each INPUT SELECT button can have a different default MODE assigned to it. To assign a default MODE for a given INPUT SELECT button, press the applicable INPUT SELECT button, SETUP/INP (input) then button # 4 (MODE). See figure 16 on page 50. Edit this parameter to select the desired default MODE, then press SETUP twice to exit. Repeat this procedure for each INPUT SELECT button.

Note: Pressing the front panel MODE function button allows the user to audition different modes for a given source, when applicable. Changing modes via the MODE button does not store a mode selection.

VFD Brightness

Each INPUT SELECT button can have a different VFD brightness assigned to it. Pressing button # 6 in figure 15 (page 50) allows the user to change the default brightness to OFF, ¼, ½, ¾ or FULL brightness. Changes to this parameter are reflected the next time that INPUT SELECT button is pressed. If this value is set to OFF, pressing any button except DISPLAY will automatically brighten the VFD to the maximum level. If the button pressed is not another INPUT SELECT or function button, then the VFD will revert back to its default brightness in X seconds. X represents the TIME parameter value in the SETUP/INP Page 1/ submenu. If the VFD is on but not set to FULL, it will remain at the default brightness until a different INPUT SELECT button is selected. The DISPLAY button will override the default VFD brightness setting. The Display Time feature takes precedence over the VFD brightness parameter. See details regarding the Display Time parameter on page 79.
The SETUP/INP Page 2 section contains the submenus shown in figure 36.

Figure 36 - Menu Map of SETUP/INP Page 2

To access this page press SETUP, INP (input), then the A-D button once. Page 2 of the SETUP/INP menu is shown in figure 37.

Figure 37 - Front Panel Display of the SETUP/INP Page 2 Submenu

**LFE Phase**

The LFE phase can be + (in phase) or – (180 degrees out of phase). This can be edited via button # 1 and is applicable to the currently selected input.

**Mapping Audio and HDMI Sources (Input Jack to INPUT SELECT button)**

Pressing button # 2 accesses 2 submenus which allow the user to assign the audio and HDMI jacks that will be active on the currently selected INPUT SELECT button. Up to three input jacks can be mapped to each INPUT SELECT button. The order in which they are mapped determines the search order when pressing the A-D button from the INPUT SELECT menu.

Press the SOURCE button (button # 2) once to display the ‘Setup Audio Source’ submenu, shown in figure 38, will be displayed.
The default jack names reflect the type of jack on the rear panel.

The INPUT SELECT buttons can be set up with 2 theories in mind. The most common used is to assign one source device to each INPUT SELECT button. Figure 10 on page 17 depicts this setup. Another option is that each person in a household can use one or two INPUT SELECT button(s) for himself or herself, and have up to 6 source devices mapped to “their” INPUT SELECT button(s). Figure 39 depicts this setup. This manual is written with the first theory in mind since as it the most commonly practiced.

To map input jacks, first press the INPUT SELECT button. Press SETUP, INP, A-D, then SOURCE. To map the first audio input jack, press button # 1 and use the LEVEL UP/DOWN buttons to select the appropriate jack. If another input jack is to be assigned to the same INPUT SELECT button, press button # 2 and select the desired rear panel input jack using the LEVEL UP/DOWN buttons. If only one mapped source is desired, choose OFF in this position. Continue with this method for up to 3 input jacks per Input Select button.

Press SETUP 3 times then repeatedly press the A-D button to toggle between the input jacks for the currently selected INPUT SELECT button. Map only the input jacks that will be used, to the currently selected INPUT SELECT button. This will eliminate needless pressing of the A-D button to cycle through unused jacks.

Note: When input jacks are re-assigned and the user exits SETUP, the new input jack mappings will not be active until either the A-D button is pressed or the INPUT SELECT button is pressed.

Press the SETUP button 3 times to return to the INPUT SELECT page.
Setup Dolby Digital

In figure 39, button #3 provides a three-page submenu which allows the user to set up preferences pertaining to Dolby Digital and Dolby Pro Logic IIx, by INPUT SELECT button. The first page of this submenu is shown in figure 47. These settings apply only when the MODE is one of the Dolby Digital processes.

![Figure 39 - Front Panel Display of the SETUP/INP Page 2/DOLBY DIGITAL Page 1 Submenu](image)

2-Channel Mode

Some Dolby Digital sources contain only two of the possible five to seven main channels. This is usually noted on the material's cover, in the form of "Dolby Digital 2.0" or "Dolby Surround" as opposed to "Dolby Digital 5.1, 6.1 or 7.1".

Embedded in most two-channel Dolby Digital data streams is an indication of whether or not the material is Dolby Surround encoded. There are three possibilities for this indication: Dolby Surround Encoded; Not Dolby Surround Encoded; or No Indication.

Regardless of the indication, the user can instruct the Casablanca III HD to process this decoded signal in virtually any MODE. For Dolby Surround encoded signals, press button #1 (2CHEN – or two-channel encoded) and use the LEVEL UP/DOWN buttons to select the MODE to be applied to Encoded 2 channel Dolby Digital signals. For a non-encoded signal, press button #2 (2CHNEN – or 2-channel non-encoded) to select the MODE for further processing. When a mode is applied to a two-channel Dolby Digital signal, the signal is first Dolby Digital decoded, then the decoded signal is further manipulated by applying the mode set in the 2CHEN or 2CHNEN parameters. If this is the case, and the additional selected mode is MATRIX, the MODE displayed in the VFD when in the INPUT SELECT MENU will read "DOLBY DIGITAL + MATX". If the additional selected mode is STEREO, the MODE displayed in the VFD when in the INPUT SELECT MENU will read "DOLBY DIGITAL + STEREO".

If the indication is that the signal is not Dolby Surround encoded, or there is no indication, and the 2CHNEN MODE is set to Dolby Digital, no additional surround processing will occur, resulting in a two-channel (stereo) output.

Compression (Night Mode)

Dolby Digital contains provisions for reducing the dynamic range of a Dolby Digital source. This means reducing the loudness of the loud passages and increasing the loudness of the quiet passages. Possible reasons for reducing the dynamic range of a source include late night listening wherein loud moments may disturb others, and making tapes for automotive / portable use wherein quiet passages may not be heard.

Casablanca III HD contains three parameters to control Dolby Digital compression. Button #3 (CMP) turns the compression ON or OFF. Button #4 (HCMP, or High Compression) controls the degree to which loud passages will be reduced. Button #5 (LCMP, or Low Compression) controls the degree to which quiet passages will be increased.

| Note: | Some Dolby Digital sources do not allow for compression, in which case altering these settings will have no effect. |

Dialog Normalization

Press button #6 to set the dialog normalization value. Dolby Digital contains the useful provision for making all Dolby Digital sources play back at the same average volume level, even though they have been recorded or mixed at very different levels. This is done by embedding in the data stream a value that the program material will need to be adjusted by to conform to an average dialog level established by Dolby Laboratories. It should be noted that the relative levels of all channels are adjusted, not just the center channel. Casablanca III HD contains two options for this setting: ANLG (analog) or DIGI (digital).
ANLG: Dialog normalization will be applied in the analog domain. This is the best-sounding and preferred setting.

DIGI: Dialog normalization will be performed in the digital domain. Digital reduction of volume results in a significant loss of resolution.

* * *

Press the A-D button to access Page 2 of the Dolby Digital set up submenu, which is shown in figure 40.

Figure 40 - Front Panel Display of the SETUP/INP Page 2/DOLBY DIGITAL Page 2 Submenu

This submenu allows the user to adjust the center, side and surround speaker delays and levels, LFE level and processing for additional speakers when the MODE is Dolby Digital.

It is important to note that the level and delay settings in this submenu are added to or subtracted from those in the main SETUP/INP/LEVELS and SETUP/INP/DELAYS submenus. For example: if the center level (CLVL) in this submenu is set to –2 and the center level in the SETUP/INP/LEVELS submenu were set to +3, the overall center level, when the MODE for the currently selected input is Dolby Digital, would be +1. This same process applies to the delays.

It is important to note that the Casablanca III HD does not support negative delays based on the theory that even we at Theta cannot make time go backwards. Therefore the sum of the delays cannot be less than 0. As an example, if the center delay in the SETUP/INP/DELAYS submenu were set at 0 and in the Dolby Digital setup submenu set at –1, the overall center delay would be 0.

In this submenu: button # 1 offsets the center speaker’s delay [from the SETUP/INP/DELAYS]; button # 2 offsets the center level; button # 3 offsets the surround left/right, sides and center surround delay; and button # 4 offsets the surround left/right, sides and center surround level.

Button # 5 controls the LFE gain setting for Dolby Digital sources containing an LFE (low frequency effects) channel. i.e. 5.1, 6.1 or 7.1 signals. This channel commonly contains sound effects such as explosions, but may also contain soundtrack information. Casablanca III HD offers the user an LFE range of between OFF and -30 for this setting. OFF may be useful for late night viewing or if there isn’t a subwoofer / speaker capable of handling the low frequencies contained in the LFE channel. 0 dB, the preferred setting, maintains the LFE setting in proper proportion to the remaining five discrete channels. Any other setting lowers the normal LFE level, in dB, by the value set.

If the incoming signal is Dolby Digital 5.1, and the user desires to create sides or a center surround channel, use the +SPKR (or Additional Speakers) parameter to indicate which MODE will be used to create them. There are a limited amount of modes that can do this. They are displayed in Table 6.

<table>

Table 6 – Additional Speaker Modes for Dolby Digital Source.
Press the A-D button to access Page 3 of the Dolby Set Up submenu. This page contains parameters used when the mode is Dolby Digital EX. This menu is shown in figure 41a.

*Figure 41a - Front Panel Display of the SETUP/INP Page 2/DOLBY Page 3 EX Submenu*

When the system has more than 5.1 channels and the incoming Dolby Digital signal is flagged as EX, then the additional channels (+SPKRs) can be created using one of the processes selected by pressing button #1, or turned off.

Press the A-D button to access Page 4 of the Dolby Set Up submenu. This page contains parameters used when the mode is Dolby Pro Logic Ilx Music. This menu is shown in figure 41b.

*Figure 41b - Front Panel Display of the SETUP/INP Page 2/DOLBY Page 3 PLIlx Submenu*

The Panorama (PRAMA) feature, when ON (button #1 in figure 41b), extends the front stereo image to include the side or surround speakers. This gives a “wraparound” effect with sidewall imaging. It is particularly effective for recordings which have strong left- or right-channel elements in the mix, as these are detected and accentuated by the Panorama process. The Panorama feature is typically intended for use with Music Mode. See figure 41c.

*Figure 41c – Diagram of Panorama Effect*
With Pro Logic IIX decoding, dominant center signals can come only from the center speaker. The Center Width (CWID) control allows variable adjustment of the center image so that it may be heard only from the center speaker; only from the left/right speakers as a phantom image; or from all three front speakers to varying degrees. The range is from 0 to 7. See figure 41d.

When all settings are made, pressing the **SETUP** button 3 times returns the user to the **INPUT SELECT** menu.

**Figure 41d – Diagram of Center Width Values**
Setup DTS

To access the DTS Setup submenu shown in figure 42, press SETUP/INP/A-D/DTS.

Figure 42 - Front Panel Display of the SETUP/INP Page 2/DTS 1 Submenu

This submenu allows the user to adjust the center, side and surround speaker delays and levels as well as the LFE and additional speaker source, when the MODE is DTS, for the currently selected input. When the Mode is not DTS, settings in this submenu will have no effect. As with the settings in the Dolby Digital Setup submenus, these DTS settings are interactive with those in the SETUP/INPUT/LEVELS and SETUP/INPUT/DELAYS submenus.

It is important to note that the level and delay settings in this submenu are added to or subtracted from those in the main SETUP/INPUT/LEVELS and SETUP/INPUT/DELAYS submenus. For example: if the center level (CLVL) in this submenu is set to –2 and the center level in the SETUP/INPUT/LEVELS submenu were set to +3, the overall center level, when the MODE for the currently selected input is DTS, would be +1. This same process applies to the delays. However, the Casablanca III HD does not support negative delays based on the theory that even we at Theta cannot make time go backwards. Therefore, as an example, if the center delay in the SETUP/INPUT/DELAYS submenu were set at 0 and in the DTS setup submenu set at –1, the overall center delay would be 0.

In this submenu: button # 1 offsets the center speaker’s delay [from the SETUP/INPUT/DELAYS]; button # 2 offsets the center level; button # 3 offsets the surround left/right, sides and center surround delay; and button # 4 offsets the surround left/right, sides and center surround level.

Button # 5 controls the LFE gain setting for DTS sources containing an LFE (low frequency effects) channel. i.e. 5.1, 6.1 or 7.1 signals. This channel commonly contains sound effects such as explosions, but may also contain soundtrack information. Casablanca III HD offers the user an LFE range of between OFF and -30 for this setting. OFF may be useful for late night viewing or if there isn’t a subwoofer / speaker capable of handling the low frequencies contained in the LFE channel. 0 dB, the preferred setting, maintains the LFE setting in proper proportion to the remaining five discrete channels. Any other setting lowers the normal LFE level, in dB, by the value set.

If the incoming signal is DTS 5.1, and the user desires to create sides or a center surround channel, use the +SPKR (Additional Speakers) parameter to indicate which MODE will be used in their creation. The modes available are:

<table>
<thead>
<tr>
<th>VFD</th>
<th>DEFINITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>No additional speaker signals will be created.</td>
</tr>
<tr>
<td>DTSES</td>

<tr>
<td>PL2MV</td>
<td>Dolby Pro Logic IIx Movie</td>
</tr>
</tbody>
</table>

Table 7 – Additional Speaker Modes for DTS Source.
Note: The +SPKR setting has no effect (is bypassed) if the mode is DTS 96/24, DTS ES Matrix or Discrete.

Pressing the A-D button once will take the user to the second DTS Setup page, shown in figure 431.

![Figure 43 - Front Panel Display of the SETUP/INP Page 2/DTS 2 Submenu](image)

In Cinema Mode, for Left/Right film soundtracks, sounds steered to the Center is subtracted from the Left/Right channels. (In Music Mode, the Center is never fully subtracted from the Left/Right channels).

CGAIN is the parameter which controls the amount of subtraction. It varies between 0 and 0.5 in steps of 0.1 and the default value is 0.2.

When CGAIN is set at 0, nothing is subtracted from the Left and Right channels. When CGAIN = 0.5, the Center channel is subtracted from the Left and Right channels at -6dB for each channel. The signal level sent to the Center channel is not affected by CGAIN. The CGAIN parameter will have an effect only when the mode is NEO:6 Music.

When all settings are made, press SETUP 3 times to return to the INPUT SELECT menu.
Post Process
To access the Post Process submenu shown in figure 44, press SETUP/INP/A-D/POST PROC.
This submenu allows the user to select an additional process to add to the incoming signal after it has been processed/decoded via the selected MODE. Only one post process can be selected per INPUT SELECT button.

![Figure 44 - Front Panel Display of the SETUP/INP Page 2/POST PROCESS Submenu](Image)

The available post processing options are:

**OFF**, which applies no further processing;

**Stereo Front/Rear (ST/FR)**, which takes signals from the front and surround lefts, adds them together and outputs this sum equally to the front left and surround left speakers. The same applies for the right front and surround speakers. The process varies slightly, depending on whether the MODE is matrix, stereo or mono;

**Party**, which takes parts of each original channel’s signal, blends them with all others and outputs this mix to all speakers. Each speaker will have a blend of all speakers;

**Center Spread (CNTR SPREAD)** is a process in which the center speaker level is reduced and added to the front left/right speakers. Press button # 5 to enable Center Spread. The level of processing is set in the BALANCE MENU/page 2 on page 83 of this manual.

Setup Input Page 3
The SETUP/INP page 3 section contains the submenus shown in figure 45.

![Figure 45 - Menu Map of SETUP/INP Page 3](Image)

Press SETUP, INP and A-D twice to enter the SETUP/INP page 3 submenu shown in figure 46.

![Figure 46 - Front Panel Display of the SETUP/INP Page 3 Submenu](Image)
Setup Miscellaneous

Press SETUP, INP, A-D twice, MISC and button # 1 to enter the MISC submenu, shown in figure 47.

![Front Panel Display of the SETUP/INP page 3/MISC Submenu](image)

**Figure 47 - Front Panel Display of the SETUP/INP page 3/MISC Submenu**

**Naming the Current Input Select button**

This parameter sets the name (VFD) for the currently selected input. Select the input to rename. The letters VFD will be displayed in the lower right above the A-D button, indicating that the name in the VFD is to be edited. VFD names are limited to 4 characters. Press the LEVEL UP/DOWN button to change characters and the LEVEL LEFT/RIGHT to change character positions. Pressing the DISPLAY button once will clear the current INPUT SELECT name. Press SETUP once to return to the SETUP/INP page 3 submenu.

**Master Delay**

With video processing, there can be a delay in the output of the video signal, causing the audio and video to be out of sync. The Casablanca III HD allows the user to set an overall, or master, audio delay in order to re-sync the audio and the video signals. In the SETUP/INP page 2 submenu, press button # 5 and use the LEVEL UP/DOWN buttons to adjust the audio delay time until the video appears to be in sync with the audio. The range is 0 to 100 mS at 48KHz.

When complete, press SETUP twice to return to the INPUT SELECT menu.

**Password for Each INPUT SELECT Button**

Press SETUP/INP/A-D/A-D and button # 3 to set a password for the currently selected input. Entering a password here will prompt the user to type in the password each time he/she wishes to change configuration settings for this INPUT SELECT.

When the PW button is pressed, “ARE YOU SURE YOU WANT TO ENTER A PASSWORD FOR THIS MENU?” appears on the VFD. Pressing NO (button # 6) reverts back to the SETUP/INP Page 3 submenu. Pressing YES (A-D button) will display a menu allowing the user to enter a password. Use buttons 1-6 to enter a 5 digit password. A zero in any position of the password will be seen as all zeros, or no password.

**Note:** PLEASE REMEMBER and/or WRITE DOWN YOUR PASSWORD! If it is forgotten, all access to password protected areas will be denied! Please refer to page 19 for additional information on using passwords.
The Six Shooter is an external preamp/analog switcher that allows the 6 analog output channels of an SACD or DVDA player to integrate with the Casablanca III HD. There are 3 inputs and one output on the Six Shooter. The first two inputs are designed to receive 6 channels of analog SACD or DVDA signal. The third input receives the first 6 output channels from the Casablanca III HD (L/R/C/LS/RS/S1). The output of the Six Shooter is connected to the amplifier inputs.

The first two inputs of the Six Shooter contain high-quality analog volume controls. The volume for these two inputs is controlled by the Casablanca III HD. Volume for the third input (first 6 channels of the Casablanca III HD) is done in the Casablanca.

To install the Six Shooter, select the appropriate INPUT SELECT button on the Casablanca III HD, then press SETUP\INP\A-D\6. Using the LEVEL UP/DOWN buttons, select the correct Six Shooter input for this INPUT SELECT button. When the Six Shooter is installed, each INPUT SELECT button must have a value of either 1 (Input #1 of the Six Shooter), 2 (Input #2 of the Six Shooter), or 3 (Casablanca III HD pass-through for all signals processed by the Casablanca III HD).

1 will route the Six Shooter's # 1 source to the amplifiers.
2 will route the Six Shooter's # 2 source to the amplifiers.
3 will route the Casablanca III HD directly to the amplifiers.

Next, for each Input Select button set to either 1 or 2, go to the Audio Source menu (SET-UP/INP/SOURCE) and set all 3 jacks to OFF.

Press SET-UP 3 times to return to the INPUT SELECT menu.

Please refer to Appendix B for a Six Shooter wiring diagram.
Setup Global

This function provides access to a series of submenus that will allow the configuration of the entire system (not by input).

Press SETUP, then GLOBAL (button # 2). The first page of the Global submenu is displayed, as shown in figure 48.

![Figure 48 - Front Panel Display of the SETUP/GLOBAL page 1/ Submenu](image)

Analog Input Levels

From the SETUP/GLOBAL page 1 menu, press button # 1 to bring up a submenu that allows adjustment of the analog input levels. This submenu is shown in figure 49.

![Figure 49 - Front Panel Display of the SETUP/GLOBAL/ANLG LVLS Submenu](image)

This function allows the user to adjust the relative ANALOG input LEVEL for each input source, for those modes which require analog to digital conversion. The allowable relative range is +19 to -14dB in 1dB increments, then steps to -16, -18 and -22dB.

**Note:** To obtain the best performance from the analog to digital conversion process, levels should be set so that the loudest passages from the source material cause the -18, -12 and -6 dB ANALOG input LEVEL LEDs on the front panel to light. Setting the input level too high will cause all four LEDs to light, thus clipping the input signal and causing distortion.

Analog output levels may vary considerably for different input sources, but program material from a given input source should be more relatively consistent. Therefore the ANALOG input LEVEL for a given source should not have to be adjusted very often. If the ANALOG LEVEL LEDs are not lit during the loudest passages from an analog source, the user could increase the ANALOG input LEVEL for that source in order to ensure a good signal to noise ratio. Another way to do this is in the 2nd Balance menu, however it is temporary. If that particular source were recorded at a particularly high or low level, the analog input level can be temporarily adjusted in the 2nd BALANCE menu.

Select the analog input to be adjusted by pressing buttons 1-6. Adjust the relative input level using the LEVEL UP/DOWN buttons, then press the SETUP button three times to return to the current INPUT SELECT page.
Remote Power Jacks

The REMOTE POWER jack and three MAIN POWER jacks on the rear panel output 12V jacks can be programmed to, output either continuous DC or a PULSE. This feature is used to automatically activate/deactivate other system components such as power amplifiers, etc, when the Casablanca III HD is taken in/out of Standby. From the first SETUP/GLOBAL page, press button #3 to access the REMPWR submenu shown in figure 51.

Figure 51 - Front Panel Display of the SETUP/GLOBAL/REMPWR Submenu

The first four 3.5 mm jacks on the rear panel (remote power and main power 1 through 3) are +12V pulse or DC current limiting* outputs (tip = hot, sleeve = ground) intended to be connected to devices which feature 12V control voltage inputs.

The first jack labeled "REMOTE", is controlled by pressing REMOTE on the hand held remote or front panel. It will turn off when the Casablanca III HD is put into standby mode.

Use button #1 to indicate whether the output of the REMOTE power jack should be 12VDC (DC) or a 12V pulse (PULSE). The specification sheet for the device being triggered should contain information as to which type of signal it requires.

The output signal of the remote power jack does not need to be delayed since its activation is by the user via either the hand held remote or front panel REMOTE button.

Use buttons 2, 3 and 4 to set the output (DC or PULSE) for each of the three MAIN POWER jacks on the rear panel.

The MAIN POWER 1 jack is activated immediately upon exiting the standby mode (pressing the front panel or the hand held remote POWER button), the MAIN POWER 2 jack is activated X seconds after exiting standby and the MAIN POWER 3 jack is activated X times 2 seconds after exiting standby. X represents the time, in seconds, that is set by pressing button #5 – MTIM, or Main [Delay] Time. This is useful for sequencing the activation of high power components such as amplifiers. When the Casablanca III HD is put into standby, it can be set to turn off the MAIN POWER jacks simultaneously or sequenced in the opposite order they were activated. Sequencing is accomplished by setting SEQ (button # 6) to ON. The default is OFF, which will turn off all triggers simultaneously when the Casablanca III HD is put into standby.

If the TYPE for any rear panel power jack is set to PULSE, the duration (in milliseconds) of this pulse can be set by the user. Select the A-D button and use the LEVEL UP/DOWN buttons to change the pulse duration.

*The current limiting resistor is 33 ohms, 0.5W. This means that the more current a triggered device draws, the more the output voltage gets reduced. The formula is: Output voltage = 12 – (I x 33), where I = the current draw from the triggered device, in Amperes. Refer to the device’s manual for this information. The Casablanca III HD’s maximum output current is 100mA. Using the above formula, with a 100mA draw, the output voltage will be 8.7 volts. Most triggered circuits have virtually no current draw.
Clear Balance  (Temporary Settings Control)

Any changes in the BALANCE menus are, by default, temporary. When a different INPUT SELECT button is pressed or the Casablanca III HD is put into standby, all changes will be reset to zero. This feature can be overridden by pressing button # 4 in the first SETUP/GLOBAL page (figure 48 on page 75) and set to OFF. When this parameter is set to OFF, all BALANCE menu settings will remain as the user changes inputs or puts the Casablanca III HD into standby.

RS232

In the first SETUP/GLOBAL page, press button # 5 to access the RS232 submenu shown in figure 52.

Figure 52 - Front Panel Display of the SETUP/GLOBAL/RS232 Submenu

Press button # 1 (BAUD) and use the LEVEL UP/DOWN buttons to select the Baud rate that matches that of the RS232 controller. The factory default value is 115.2K

The Casablanca III HD can be set to automatically feedback to the RS232 port. Button # 2 (ECHOS) [Echo Status] allows the user to enable or disable the output of data to the RS232 port and, if enabled, determine which level, or pre-determined group of bytes, it outputs. This can be done by selecting a “Status Level”, which means if any Casablanca III HD parameter changes, that level's bytes will be sent to the port. This is useful for monitoring master level, input and the like when the user has access to both the Casablanca III HD and the touch-panel controller, to keep them synchronized. If this value is OFF, no parameter change information will output to the RS232 port.

Status levels 1, 2, 3 and 4 permit increasing levels of data to be sent to the RS232 port. If RS232 is not being used, ensure that the Echo Status (ECHOS) parameter is set to OFF. Higher settings can slow the operation of the Casablanca III HD.

An RS232 Protocol addendum which describes all pertinent RS232 information, including values contained within each Status Level is available for download from the Theta Digital website, in the “Library” section. (www.thetadigital.com)

Mute/Volume

This submenu provides the user with a method of setting volume and mute control parameters. Press SETUP, GLOBAL, then button # 6 (MUTE/VOLUME). This submenu is shown in figure 53.

Figure 53 - Front Panel Display of the SETUP/GLOBAL/MUTE-VOLUME Submenu
## Initial Power-On Master Volume

Button # 1 (INILVL, or Initial Level) allows the user to store the initial master volume setting that the Casablanca III HD defaults to out of standby.

### FVOL and SVOL

When certain parameters are edited or the master volume changed, holding the LEVEL UP/DOWN button for more than 5 steps will, by default, speed up the rate at which the value changes. This is referred to as Fast Mode. It is possible to delay the speed of the Fast Mode to the user’s preference. On FVOL (Fast Volume – button # 2) a delay of 0 (0 milliseconds between steps) will set the Fast Mode to be its quickest, and a delay of 255 (255 milliseconds between steps) sets it to be its slowest.

The response rate of the LEVEL UP/DOWN buttons during the first 5 steps is referred to as Slow Mode. Button # 3 - SVOL allows the user to modify the speed of increment changes during these first 5 steps. In SVOL (Slow Volume) a delay of 0 will set the Slow Mode to be its quickest, a delay of 255 sets it to be its slowest.

## Maximum Overall Level

Button # 4 (MAX) allows the user to set a maximum master volume level. This is especially useful in a household where young relentless children and smart pets have access to the system or the speakers are very efficient.

## Changing the Default MUTE Level

The user can set the master volume level that the Casablanca III HD goes to when the front panel or hand-held remote MUTE button is pressed. Editing this parameter is accessed by pressing button # 5.

### MUTE Off Trigger

The Casablanca III HD can be un-muted in 2 ways. Setting the parameter (accessed via button # 6) to MUTE allows only the MUTE button to un-mute the Casablanca III HD. Setting this parameter to M+V (MUTE and VOLUME) allows both the MUTE and LEVEL UP/DOWN buttons to un-mute.

Press the SETUP button once to return to the SETUP/GLOBAL page 1 submenu. Press the A-D button once to go to the second GLOBAL page, shown in figure 54.

![Figure 54 - Front Panel Display of the SETUP/GLOBAL page 2 Submenu](image)

### Cursor Type

When editing jack or input select names, the VFD character being edited can be indicated by blinking, a flashing cursor below it, both, or no indication. This preference is set in the SETUP/GLOBAL page 2 submenu, button # 1.
**Displaying Mode Change Messages**

When the Casablanca III HD receives a Dolby Digital or DTS signal on the currently selected input and the MODE is not the one required to process these signal formats, a message will briefly appear on the VFD stating that the Casablanca III HD has received a certain format and is temporarily changing the MODE. This message does NOT come up by default but can be turned on by pressing button #2 and changing the value to ON.

**Note:** If the default MODE is DOLBY DIGITAL or DTS and a 96K signal is received, the Casablanca III HD will momentarily display a message (if the MSG parameter is set to ON) indicating that it is receiving a 96K signal and [temporarily] changing the current mode to STEREO. Neither Dolby Digital or DTS can process a standard 96K signal, therefore the MODE is changed to STEREO in order to have audio output. The user can change this mode, after it has been changed to STEREO, by using the MODE button to select a different and applicable MODE.

**Display Time**

The Casablanca III HD’s display brightness will automatically dim to ¼ if no button has been pressed for X time. \(X\) is the value, in minutes, from the DTIM (Display Time) parameter under button #4 of the 2\(^{nd}\) Global menu page.

**Serial Number**

Press button #5 to display the serial number.

* * *

When all settings are complete in this submenu, press SET-UP twice to return to the INPUT SELECT menu.
Macros

The Casablanca III HD contains several useful macros that allow the user to perform multiple tasks at the press of a button. To enter the Macros submenu, press SETUP, then MACROS (button # 3). The Macros submenu appears, as shown in figure 55.

![Figure 55 - Front Panel Display of the SETUP/MACROS Submenu](image)

Copy Macros

Buttons 1 and 2 are “copy” macros. ALLINP (button # 1) allows the user to copy all INPUT SELECT parameters from the currently selected input to one or all input select buttons. To copy to a specific input select button, the Casablanca III HD will prompt the user to select the INPUT SELECT button to copy to. If the currently selected INPUT parameters are to be copied to input select buttons 7-12, press the A-D button when given the choice of the destination INPUT SELECT button to be copied to.

If a password protected INPUT SELECT is being copied to, the user will be prompted to enter that password.

**Note:** When copying all INPUT parameters to other INPUT SELECT buttons, the SOURCE (audio and video) settings will not be copied.

Typically when setting up the Casablanca III HD in the system for the first time, speaker configuration settings established for the first INPUT SELECT button will be virtually the same for all other INPUT SELECT buttons. This macro allows only the speaker configuration, levels and delays to be copied to one or all INPUT SELECT buttons.

Restore Macros

Button # 3 allows the user to restore the factory settings in a variety of ways. The Restore menu is shown in figure 56.

![Figure 56 - Front Panel Display of the SETUP/MACROS/RESTORE FACTORY Submenu](image)

In this submenu, button # 1 allows the user to restore factory INPUT parameters to the currently selected input button. The input name will not be changed.

Button # 2 will restore factory INPUT parameters to all 12 INPUT SELECT buttons. Input select names will not be changed.

Button # 3 will restore all factory GLOBAL menu settings.

Button # 4 will restore all factory NAMES. This includes jack names and INPUT SELECT button names.
Button # 5 will restore all factory settings, INPUT, GLOBAL and NAMES to the Casablanca III HD.

Before any macro is executed the user will be asked “Are you sure you want to perform this macro?”. Press YES (A-D button) or NO button # 6). The Casablanca III HD will prompt “Complete”. Press OK (A-D button) to return to the Macros menu.

**Note:** If restoring factory defaults to an INPUT SELECT button that is password protected, the Casablanca III HD will ask for the password by input name.

Press SETUP twice to return to the first page of the SETUP menu.
BALANCE Function

This function allows the user to temporarily set the FRONT/REAR and LEFT/RIGHT balances, the center and subwoofer speaker levels, the shelf EQ, and a relative adjustment of the analog input level, in order to compensate for distinct program material characteristics.

*The parameter values in the two BALANCE pages are, by default, temporary. When the user presses a different INPUT SELECT button or puts the Casablanca III HD into standby, changes made will revert to 0. This feature has an override, (CLRBAL), which is accessed via the SETUP/GLOBAL submenu, button # 4.

The first page of the balance menu is shown in figure 57 and the second in figure 58.

![Figure 57 - Front Panel Display of the BALANCE Page 1 Menu](image1)

Front/Rear and Left/Right Balance

The BALANCE adjustments are made with reference to the relative speaker trim levels that are stored in the SETUP/INP/LVLS submenu. LEVEL LEFT/RIGHT adjusts the Left/Right balance and LEVEL UP/DOWN adjusts the Front/Rear balance.

![Figure 58 - Front Panel Display of the BALANCE Page 2 Menu](image2)

Pressing the A-D button once will reveal the second BALANCE page, which will allow temporary level changes to the center (CEN) speaker, subwoofer (SUB), EQ and analog input level (ANLVL).

Center and Sub Balance

Press button # 1 to adjust the center level and button # 2 to adjust the subwoofer level.

Shelf EQ

Pressing button # 3 will allow the user to adjust the EQ setting to OFF, 1, 2, 3 or 4. This is a low pass shelf EQ.
that, at 2KHz, drops by 1.5dB when the parameter value is set at 1, 3dB when set at 2, 6dB when set at 3, and 9dB when set at 4. The EQ is active in all modes and is designed to roll off excessive brightness in different program material.

**Analog Input Level Override**

Button # 4 lets the user adjust the analog input level of the currently selected input, relative to the stored value in the SETUP/GLOBAL/ANLG LVLS (analog levels) menu.

Press the BALANCE button twice to return to the current INPUT SELECT menu.

**Center Spread**

This is a post process activated in the POST PROCESS submenu. The range (0-15) is set in Page 2 of the BALANCE MENU. This parameter adjusts the mix between the center speaker and the front left/right speakers. The higher the value, the more center channel level is reduced in the center speaker and added into the front left/right speakers. If the value is 15, all of the center channel information would be routed to the front left/right speakers. In this case it would be the same as phantoming the center speaker.
**STATUS Function**

This feature, accessible from the hand held remote or RS232 control device, provides the user with a ‘quick view’ of the most pertinent current settings of the Casablanca III HD. It is available from any menu or submenu by pressing the **STATUS** button. While viewing the Status pages, the **INPUT SELECT** buttons (1 - 6) are inactive. Pressing a function button will clear the **STATUS** display and show the current function menu.

![Figure 59 - Front Panel Display of the STATUS Display](image)

When the **STATUS** display is activated, the following will always appear in the VFD, as shown in figure 59:

- The current **MODE** (Default or temporary).
- The currently selected input jack name (**SRCE**, or Source).
- The analog **TAPE OUT** audio source to be recorded, by Input jack name.
- The **EQ** parameter value of **OFF**, 1, 2, 3, or 4. (Stored or temporary).
- The **PHASE** parameter value of + (0°) or - (180°).
- The Sample Rate (**SRTE**) of the signal currently being received.
- The Master Volume (**LVL**) setting.

Press the **A-D** button once to display the Dolby Digital Status page, an example of which is shown in figure 60.

![Figure 60 - Front Panel Display of the STATUS/Dolby Digital Display](image)

The Dolby Digital status displays information that may be embedded in the Dolby Digital datastream. The information can be correct only if a Dolby Digital source is active. Each parameter on the first page is described below:

- **Channels (CHANS):** Displays the number of main channels in the source signal.

- **LFE:** Displays whether an LFE track is present or not.

**Surround Mode (SMODE):** Displays the surround mode. See **SETUP/INP Page 2/DOLBY DIGTL Page 1**, parameter value of **2CHEN** and **2CHNEN** for Casablanca III HD’s use of this parameter. This can be found
Dolby Digital EX Flag (EXFLG): Displays whether or not there is a flag in the incoming Dolby Digital signal, indicating whether the signal is EX encoded or not.

Sample Rate (SRATE): Displays the sample rate.

Dialog Norm (DIANRM): Dialog normalization value. See the Setup Dolby Digital Dialog Normalization on page 66 for Casablanca III HD’s use of this parameter.

Press the A-D button once more to display the DTS Status page, an example of which is shown in figure 61.

![Figure 61 - Front Panel Display of the STATUS/DTS Display](image)

Each parameter on the DTS Status page is described below:

Channels (CHANS): Displays the number of main channels in the source signal.

LFE: Displays whether an LFE track is present or not.

DTS ES Flag (ESFLG): Displays whether or not there is a flag in the incoming DTS signal, indicating whether the signal is ES encoded or not.

Sample Rate (SRATE): Displays the sample rate.

Frequency Extension (FQ EX): Indicates whether the 96K signal is native or doubled.

Continuously pressing the A-D button will cycle between the 3 Status pages.

Press the STATUS button once to exit the Status pages.
REMOTE
CONTROL
Remote Control Layout

1. **POWER.** After the rear panel **MAIN POWER** switch is turned on, press this button to exit the standby mode and to put the unit into operational mode.

2. **OFF.** Pressing this button will place the Casablanca III HD into standby mode, turning off the VFD and muting all audio outputs.

3. **PAGE SELECT.** Chooses the unit to be controlled by this remote.

4. **VOLUME UP.** Raises the master volume for all outputs. Also increments parameter values in most edit modes and shifts **FRONT/REAR** audio in the first **BALANCE** menu.

5. **VOLUME DOWN.** Lowers the master volume for all outputs. Also decrements parameter values in most edit modes and shifts **FRONT/REAR** audio in the first **BALANCE** menu.

6. **MUTE.** Mutes all analog audio outputs except the **TAPE OUT** jacks. Press again to disable muting.

7. **SELECT + and −.** Incrementally changes the active **INPUT SELECT BUTTON.**

8. **LEVELS LEFT** and **RIGHT.** Shifts the audio balance to the left or right in the first **BALANCE** page; used to adjust the **MASTER** volume level when in most submenus; used to change **INPUT SELECT** pages.

9. **A-D.** Sequences through input jacks assigned (mapped) to the active **INPUT SELECT** button. Also toggles between menu pages.

10. **SETUP.** Accesses submenus for setting speaker configurations/levels/delays, analog input levels, naming inputs, setting the display & remote features, selecting the video type, setting options for incoming Dolby Digital, DTS and much more.

11. **REMOTE.** Activates/deactivates the **REMOTE POWER** jack on the rear panel.

12. **INPUTS.** Individual buttons which select the desired input. Within a function’s submenu page(s), these buttons select sub functions to edit. When pressed, the corresponding LED on the front panel is activated.

13. **DISPLAY.** Temporarily overrides the VFD display brightness level.

14. **TAPE OUT.** Used to route audio signals to the **TAPE OUT** jacks.

15. **PHASE.** Inverts the phase (0/180°) of all speaker outputs.

16. **STATUS.** Displays the current status of the Casablanca III HD on the VFD, and on the video monitor if optional video card is installed and video display is enabled.

17. **MODE.** Activates/deactivates the **MODE** select pages for currently selected input.

18. **BALANCE.** Activates the **BALANCE** menus allowing a temporary balance configuration to be set in order to adjust for different program characteristics.

**Note:** When operating the hand-held remote control, point it at the remote sensor on the Casablanca III HD’s front panel. The remote control can be used 3 to 20 feet from the Casablanca III HD within 30° of each side of the sensor. Exposing the remote sensor to direct sunlight or strong light may cause faulty operation.
REMOTE CONTROL OPERATIONS

This section describes the functionality of the Casablanca III HD using the hand-held remote only. For front panel functional descriptions, please refer to FRONT PANEL OPERATIONS on page 44. Introduction to the User Interface section on page 19 will also be helpful. Descriptions for remote buttons/functionality not covered in this section can be found in REMOTE CONTROL LAYOUT on page 87. Features and functional descriptions which are common to both front panel and remote operations are covered in the FRONT PANEL section and therefore not repeated in this section.

Input Select Menus

When the rear panel MAIN POWER switch is turned on, the Casablanca III HD identifies internal hardware and software, then enters standby mode (the POWER LED turns on).

Changing Inputs and Input Select Pages

Press buttons 1 through 6 or SELECT UP/DOWN to choose a desired INPUT SELECT button. An arrow will point to the currently selected input. The input names shown in this figure are for example only and will most likely differ from the user’s set up. There are two INPUT SELECT pages, giving the user a total of 12 INPUT SELECT BUTTONS to choose from. Press the LEVEL RIGHT button to select the INPUT SELECT 2 menu. Press the LEVEL LEFT button to select the INPUT SELECT 1 menu.

Pressing the VOLUME UP/DOWN buttons will adjust the master volume for all speakers. This value ranges from 0 to 73 (relative maximum).

Selecting Mapped Input Jacks for the Currently Selected Input

Pressing the A-D button will toggle between the input jacks mapped to this INPUT SELECT button. Please refer to page 46 (Search Order) for important, detailed information regarding input mapping options.

Mute

The MUTE button will toggle the audio between the master volume level and MUTE level in all speakers each time it is pressed. Please refer to pages 45 and 78. (Default mute level/mute off trigger) for additional information on the MUTE feature. The MUTE feature is active in all menus.

Display

The DISPLAY button will toggle the VFD brightness between OFF, ¼, ½, ¾ and FULL brightness. This feature will have no effect on the video display. When the VFD is turned OFF, the red logo LEDs also turn off.

Global Phase

Repeatedly pressing the PHASE button toggles the main audio outputs’ phase between 0 and 180 degrees, and displays this on the monitor for approximately 1 second after being released. The PHASE parameter is only accessible from the remote.
STATUS Display

This display, accessible from the hand held remote and viewed on the VFD, provides the user with a ‘quick view’ of the most pertinent current settings of the Casablanca III HD as well as information about a Dolby Digital source. The status page is available from any menu or submenu simply by pressing the STATUS button.

When the STATUS display is activated, its title is displayed in the upper left corner along with the following:

- The current INPUT SELECT BUTTON NAME.
- The current mapped input jack.
- The MODE.
- The TAPE OUT audio source.
- The shelf EQ parameter value (OFF, 1, 2, 3, or 4).
- The PHASE parameter value (0° or 180°)
- The Sample rate (S RATE) of the currently selected source.
- The MASTER VOLUME level.

Press the A-D button once to display the status of the current Dolby Digital source. Press A-D once more to display the status of the current DTS source.

Note that a Dolby Digital or DTS source needs to be playing in order to display the correct values on these status pages.

Please refer to page 844 for additional information pertaining to Dolby Digital Status menu and page 85 for the DTS Status menu.

Pressing the STATUS button once will clear the status display. Pressing a function button will clear the status display and show that menu.
MODE Function

This function allows the user to audition MODEs for the currently selected input. Storing a default MODE is done in the SETUP/INPUT page 1 submenu.

Pressing the MODE button once displays the first page of the MODE menu. This page consists of 6 different signal processing modes, one of which can be selected and temporarily applied to the current input.

Please refer to page 66 for additional information regarding Dolby Digital options, page 70 for additional information regarding DTS.

* * *

After selecting a temporary mode for the current input, press the MODE button once more to clear the video monitor. The MASTER VOLUME can be controlled using the LEVEL UP/DOWN buttons in these 3 menus.

TAPE OUT Function

This feature simultaneously controls the routing of signals to the audio and video tape out jacks.

Pressing the TAPE OUT button once displays the TAPE OUT menu. The menu title “TAPE OUT” is displayed. The INPUT NAMES shown in this figure are for example only and will most likely differ from the users’ set up.

To route a signal to the appropriate TAPE OUT jack(s), press the TAPE OUT button, press button # 1. Use the LEVEL UP/DOWN buttons to assign an audio source to the audio TAPE OUT jacks. Press button # 3 and the LEVEL UP/DOWN buttons to assign a video input jack to the video TAPE OUT jacks.

This menu is dynamic. When the audio source is from an analog jack, the digital tape out jacks are disabled. This is indicated on the VFD. When a digital input jack is selected as the source, it is routed to both the analog and digital tape out jacks. When the main DACs are selected (default), this is indicated on the VFD. If the optional tape out DAC is not installed, the option to select it (via button # 5) is not shown.

Button # 5 allows the user to select whether the signal on the analog TAPE OUT jacks will be derived from the main output DACs or the optional tape out DAC (if installed), by displaying MAIN or TAPE on the display. If the optional tape out DAC has not been installed, there will be no option to edit above button # 5. This setting is only relevant if the analog tape out source is set to a digital input jack. All analog inputs are routed directly to the TAPE OUT jacks, without A/D to D/A conversion.

When routing is completed, press TAPE OUT to clear the video display. The MASTER VOLUME can be controlled in this menu via the LEVEL LEFT/RIGHT buttons.

Please refer to page 50 for additional TAPE OUT features and options information.

CAUTION: It is not advisable to route a 5.1 source (DTS/AC-3) to the optional tape out DAC. This section does not contain Dolby Digital or DTS decoding capabilities. Full scale noise will be output!
Default Mode

Each INPUT SELECT button can have a different default MODE assigned to it. To assign a default MODE for a given INPUT SELECT button, first press the applicable INPUT SELECT button, SETUP, INPUT then button # 4 (MODE). Use the LEVEL UP/DOWN buttons to edit this parameter and select the desired default MODE. Press SETUP twice to exit. Repeat this procedure for each INPUT SELECT button.

Note: Pressing the front panel MODE function button allows the user to audition different modes for a given source, when applicable, however changing modes via the MODE button does not store a mode selection.

Six Shooter

The Six Shooter is an external device that allows the 6 analog output channels of an SACD or DVDA player to integrate with the Casablanca III HD. There are 3 inputs and one output on the Six Shooter. The first two inputs are designed to receive SACD or DVDA signals. The third input receives the first 6 output channels of the Casablanca III HD. The outputs of the Six Shooter are connected to the amplifier inputs.

The first two-channels of the Six Shooter contain volume controls. The volume for these two inputs is controlled by the Casablanca III HD.

When the Six shooter is used, the user first selects the appropriate INPUT SELECT button on the Casablanca III HD, then press SETUP/INP/A-D/A-D/6SHOT. Using the LEVEL UP/DOWN buttons, select which Six Shooter input will be used. For all other INPUT SELECT buttons on the Casablanca III HD, set this parameter to 3 so that the incoming signal is routed from the first 6 outputs of the Casablanca III HD into Input # 3 of the Six Shooter (which is a bypass) and then directed to the amplifiers.

Please refer to Appendix B for a Six Shooter wiring diagram.

Displaying Mode Change Messages

As discussed in the MODE section of this manual, when the Casablanca III HD receives a Dolby Digital or DTS signal on the currently selected input and the MODE is different from the incoming signal, a message will briefly appear on the VFD stating that the Casablanca III HD has received a certain format and is temporarily changing the MODE. This message is turned off by default but can be turned on. Pressing button # 2 and changing the value to ON achieves this.

Note: If the default MODE is DOLBY DIGITAL or DTS and a 96K signal is received, the Casablanca III HD will momentarily display a message (if the MSG parameter is set to ON) indicating that it is receiving a 96K signal and [temporarily] changing the mode to STEREO. The user can then change this mode by using the front panel MODE button and selecting a different and applicable MODE.

Display Time

The Casablanca III HD's display brightness will automatically dim to ¼ if no button has been pressed for X minutes. The value set in the DTIM (Display Time) parameter under button # 4 of the SETUP/GLOBAL page 2 menu.

Serial Number

Press button # 5 to display the serial number of this Casablanca III HD.

* * *
APPENDIXES
## Appendix A  Troubleshooting Guide

If the Casablanca III HD should function abnormally during operation, please review the items in the following checklist. Please be sure to thoroughly check all other connected components such as speakers, amplifiers, input devices (CD/LD transport, VCR, TV, etc.) as well as cables.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Cause(s)</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mute on permanently.</td>
<td>No Lock LED.</td>
<td>Verify valid data at selected digital input.</td>
</tr>
<tr>
<td>No power or front panel lights and no sound.</td>
<td>No digital source connected.</td>
<td>Verify that source is securely connected.</td>
</tr>
<tr>
<td></td>
<td>Power cable is not inserted 100% into IEC connector.</td>
<td>Ensure that the AC cord is inserted all the way into the Casablanca III HD and that the wall outlet is active.</td>
</tr>
<tr>
<td></td>
<td>Circuit breaker is open (AC outlet or Casablanca III HD).</td>
<td>Check the AC outlet circuit breaker and reset, if necessary or contact your dealer.</td>
</tr>
<tr>
<td>No &quot;LOCK&quot; light.</td>
<td>Defective or intermittent cable.</td>
<td>Verify that the digital cable is not defective by checking the continuity, that both ends are firmly connected. If possible, try a different cable.</td>
</tr>
<tr>
<td></td>
<td>Digital source is not selected in the search order.</td>
<td>Toggle the A-D button until the jack name for the desired source is displayed.</td>
</tr>
<tr>
<td></td>
<td>Defective source component.</td>
<td>Verify that the source component is functioning correctly and outputting valid digital data.</td>
</tr>
<tr>
<td></td>
<td>Source component improperly connected.</td>
<td>Ensure that the output cable from the source component is connected to its active digital output.</td>
</tr>
<tr>
<td>No audio output.</td>
<td>No Lock LED.</td>
<td>Verify valid data at selected input.</td>
</tr>
<tr>
<td></td>
<td>NOISE SEL activated with no speakers selected.</td>
<td>In the SETUP/INPUT/LEVELS submenu, verify that the SOURCE parameter is set to SOURCE (A-D button).</td>
</tr>
<tr>
<td>Distortion from analog input.</td>
<td>Clipping.</td>
<td>Adjust analog input level until the red clip LED goes off.</td>
</tr>
<tr>
<td>No output from a speaker.</td>
<td>Speaker set to OFF or PHTM (Phantom).</td>
<td>In the SETUP/INPUT/CONFIG submenu, set the speaker to an appropriate parameter for your system.</td>
</tr>
<tr>
<td>Low output from an analog source.</td>
<td>Analog input level set too low.</td>
<td>Increase analog input level as high as possible without clipping.</td>
</tr>
<tr>
<td>No Sub Woofer.</td>
<td>SUB is set to 0.</td>
<td>Set the number of SUBs to reflect the current speaker configuration in the SETUP/INPUT/CONFIG submenu.</td>
</tr>
<tr>
<td></td>
<td>The currently selected MODE does not support sub woofers.</td>
<td>Review the MODE Function section, detailed on pages 47 – 49 to select a MODE that functions for both the current input signal format as well as the desired speaker or system configuration.</td>
</tr>
<tr>
<td></td>
<td>No speakers are crossed over.</td>
<td>Ensure that one or more speakers are crossed over in the SETUP/INPUT/CONFIG submenu.</td>
</tr>
<tr>
<td></td>
<td>The current program material does not contain an LFE track.</td>
<td>N/A.</td>

Appendix B Speaker Placement Guides

Figure 63 - Recommended Speaker Placement for Six-Channel Configuration

Figure 64 - Recommended Speaker Placement for Twelve-Channel Configuration
Figure 65 - Recommended Output Wiring Diagram Using 12-channels (Six Balanced and Six Single-Ended)

Figure 66 - Recommended Output Wiring Diagram Using 8 balanced Xtreme channels
Digital Out/External Volume Control Wiring Diagrams

With the optional Digital Output Card installed, there are no additional menu features to select from. The card can be installed in any Analog Out slot in the Casablanca III HD. However, if it is installed in conjunction with another D/A card that has front left and right analog outputs on it, the Digital Out card must be positioned in the Analog Out 2 or 3 slot in order for the Analog Direct and Analog Matrix modes to function.

Connect one of the 3 Left/Right digital outputs to the input of a two-channel external Digital to Analog converter (DAC). If a two-channel External Volume Control (EVC) unit is being utilized, connect the left/right outputs of the DAC to the corresponding left/right inputs of the two-channel EVC. Then connect the left/right outputs of the EVC to the left/right inputs of the front [left/right] power amp inputs.

Lastly, connect the VOL1 on the Digital output card to the VOLUME jack on the EVC. This allows the master volume parameter from the Casablanca III HD to be transmitted to the EVC, thereby controlling the volume from the DAC. All connections are shown in Figure 67, above.

Figure 69 shows the wiring diagram using one 6-channel EVC. If two EVCs are being used, connect the VOL2 on the digital output card to the VOLUME jack on the second EVC. The second EVC must be configured to respond to channels 7-12. This will be done at the factory. Connect the second EVC to the appropriate channels (Surround Center/Side Left/Side Right/Sub 1-4) of the digital out card as was done with the first EVC.

In the case where the Digital Output card has the optional analog center channel output installed, connect this output directly into the center channel power amp input.

Appendix C  Remote Extender Jack Technical Description and Protocol

The remote extender jack on the Casablanca III HD rear panel serves as a direct electrical pathway to the input section of the main microcontroller. Using this jack eliminates the need to attach an IR transmitting device to the front panel IR receiver. This input requires a demodulated signal. **

Remote system: Phillips RC5

Electrical Requirements:

Jack: 3.5mm stereo mini-phone  
Tip: 12v current limited dc supply from Casablanca III HD (for phantom power)  
Ring: Signal, 0-5 v peak-to-peak. (Is pulled high in Casablanca III HD)  
Sleeve: Ground

**There are companies who manufacture units that strip the IR carrier from a signal. One such company is Xantech, who makes the model 794-10. If this unit is used, a series of dipswitches need to be set on it. These settings are as follows:

(from switch 1 to 10)  
1 0 1 1 0 0 0 1 0 1

where 1 = ON and 0 = OFF
Appendix D  Upgrading/Re-installing Casablanca III HD Software

The most dynamic parts of Casablanca III HD’s internal operating system and supporting files are stored in flash memory and are therefore easily updateable via an IBM compatible PC.

To install new software into the Casablanca III HD, first the “Downloader” software must be installed on a local PC. Instructions for this installation are included with the CD ROM. This software is referred to as Theta Digital Downloader (TDD) x.xx, where x.xx is the version number. The latest version of TDD as well as the latest CB3 Flash files themselves are available from Theta Digital, through a Theta Digital authorized dealer or on the Theta website (www.thetadigital.com) in the Library/Downloads section.

When TDD “connects”, it will take over control of the Casablanca III HD. When updating it will read and store the internal hardware configuration and user settings and then update and/or overwrite the flash files on every board. It will then restore the hardware configuration parameters that were set at the factory as well as the user settings.

TDD can also save all user settings to the hard drive of a PC. This is a highly recommended procedure to do, immediately after setting up the Casablanca III HD for the first time, prior to updating the software, or when making changes to the user settings.

When TDD is installed onto the PC, a PDF file entitled “Guide to Using TDD” is copied to the hard drive. This document covers the detailed information required to use TDD in all of its modes. It is recommended that this document be read through in its entirety before using TDD.

Appendix E  Re-installing Casablanca III Settings

Do not attempt to restore settings from a previous generation of the Theta Casablanca to the Casablanca III HD using Crystal or any other program.

The operating system of the Casablanca III HD is not compatible with this program. Attempts to restore old settings will result in severe software corruption that will disable the Casablanca III HD and may require reinstallation of the operating system at the factory.

Such reinstallation is not covered under Theta’s warranty.

Individual settings from a Casablanca III should be copied manually to a notepad or other document and then restored manually using the setup instructions in this manual.
Appendix E Specifications

Digital Input Section (32KHz, 44.1KHz, 48KHz, 88.2KHz, 96KHz compatible):

Main digital input board:
Inputs: 10:6 coaxial (RCA), 4 optical (2 TosLink, 2 open for optional AT&T).
Outputs: 2 digital tape out coaxial on RCA jacks.

Auxiliary Digital Input board:
Inputs: 5: 2 AC-3 RF (RCA) for laserdisc Dolby Digital, 1 AES/EBU (XLR), 1 BNC, 1 TosLink.
Outputs: Volume Data.

Analog Input Section:
Inputs: 6 stereo pair on RCA jacks.
Input Level: 200 mV RMS minimum, 22v RMS maximum.
Input Impedance: 10 KΩ.
Outputs: 2 stereo pair on RCA jacks for analog tape out.
Tape Output Impedance: 36.5 ohms
A/D Conversion: 20-bit Delta-Sigma at 48KHz; separate delta-sigma modulator and high performance decimating digital filter.
Frequency response: +-.2dB 20Hz - 20KHz
THD+Noise: 0.0026%
Dynamic Range: 104dB
Signal to Noise Ratio: 104dB
Input volume control: Theta proprietary switched resistor network in the analog domain.
Automatic DC canceling circuit.

Processing (DSP) Section:
All DSP processing is 24bit with 56 bit accumulator. Some processes, such as low pass crossovers, are 48bit with 56 bit results.

Channels Supported: Left, Right, Center, Left Surround, Right Surround, Center Surround, Left Front Sub, Right Front Sub, Left Surround Sub, Right surround Sub, Center Sub, Left Side, Right Side.

Modes: Matrix, Special Matrix, Dolby Pro Logic, Dolby Digital, DTS, Stereo, Mono, Analog Direct, Analog Matrix.

Post Processes (applied in addition to selected mode): Stereo Front/Rear, Party, Center Spread.

EQ: Four levels of high frequency roll-off (shelf-type) to compensate for overly bright sources.

Crossovers: Separate crossovers for each of the following: Front Left/Right, Front Center, Surround Left/Right, Surround Center. Three types supported: Linkwitz-Riley, Butterworth, Phase Perfect. Crossover frequencies: 40Hz, 50Hz, 63Hz, 80Hz, 125Hz, 160Hz. Crossover slopes: 6dB, 12dB, 18dB, 24dB per octave. Butterworth crossovers have separate adjustments for high and low pass.

Subwoofers: Up to five subwoofers supported. 1- single subwoofer, 2- left/right subwoofers, 2- front/rear subwoofers, 3- left/right/surround subwoofers, 4- left/right/surround left/right/surround right subwoofers, 5- left/center/right/surround left/right/surround right subwoofers. Each subwoofer can be set to receive a full range signal in case the sub has an internal crossover that cannot be defeated.

LFE: Phase adjustment (0, 180 degrees), level adjustment (0dB to -30dB, off)

Delays: Master (applies to all channels) delay for syncing with video processors, comprehensive separate delay settings for all speakers including subwoofers.

Analog Audio Outputs: See additional pages.

Control Section:
RS232: Complete ability to control and read status of every operational parameter of unit.
IR Receiver: 3.5mm stereo phone jack (rear panel), unmodulated.
IR Receiver: Front panel IR window for hand-held remote control.
Remote Power: 4 rear panel 3.5mm mono phone jacks: +12VDC triggered (Can be set to Pulse or Continuous DC), pulse time variable from 0 to 255 mSec. Up to 100mA each. See page 77 for more detail.

Specifications subject to change without notice.
HDMI Section

Four HDMI 1.4 inputs
One HDMI 1.4 output
HDCP Compliant

* * *

Power Requirements: 117 VAC, 50-60 Hz, 120 watts with all options installed.

Dimensions: 19"W x 16"D x 7.5"H (483 x 406 x 191 mm)

Weight: 43 Lbs (19.5 Kg) Stand alone, 50 Lbs (22.7 Kg) Boxed with accessories

Environment: Operating Temperature: 32 to 95 F (0 to 35 C)
Storage Temperature: -22 to 167 F (-30 to 75 C)
Relative Humidity: 95% maximum without condensation

Remote Control: 1 hand-held, battery powered control unit uses 2 AAA batteries

Superior II Balanced/Unbalanced D/A Output Card

Output Options:

- Front Left/Right/Center.
- Front Left/Right/Sub 1.
- Sub 1/Surround Left/Right.
- Sub 2/Surround Left/Right.
- Sub 2/Sub 3/Sub 4.
- Sub 2/Sub 3/Surround Center.
- Sub 2/Side Left/Right.
- Surround Center/Sub 1.
- Surround Center/Sub 2.
- Surround Center/Sub 3.
- Surround Center/Sub 4.
- Surround Center/Surround Left/Right.
- Surround Center/Surround Right.
- Surround Center/Surround Left/Right.
- Surround Center/Surround Right.
- Sub 2/Surround Left/Right.
- Front Center/Surround Left/Right.

Each output channel has a balanced (XLR) and a single-ended (RCA) output connector.

D/A Conversion: 24-bit Ladder (8X oversampling - 4x oversampling for 96KHz sources). Two DACs per channel (6 per board) for true differential operation.

Volume Control: Theta proprietary switched resistor network in the analog domain.

Digital Filter: Theta proprietary FIR filter running on Motorola 56362 DSP.

Single-Ended Output: Summed from balanced signals, retains many of the advantages of the balanced output.

Sample Rates Supported: 32KHz, 44.1 KHz, 48 KHz, 88.1 KHz, 96 KHz.

Balanced Output Specifications:

- Output Impedance: 20 Ohms.
- Maximum Output Level: 20 V RMS.
- Frequency Response: 20 Hz-20 kHz, ± 0.01 dB, Ref. 1KHz.
- THD+Noise: Less than 0.0016% @ 1KHz, maximum output level.
- Dynamic Range: 105dB minimum, 20KHz bandwidth, Ref. 1KHz, A-weighted.
- Signal to Noise Ratio: 105dB typical, idle channel, A-weighted.
- Crosstalk: -90dB Right - Left, -120dB Center-Left @ 20KHz.

Single-Ended Output Specifications:

- Output Impedance: 10 Ohms.
- Maximum Output Level: 10 V RMS.
- Frequency Response: 20 Hz-20 kHz, ± 0.01 dB, Ref. 1KHz.
- THD+Noise: Less than 0.0016% @ 1KHz, maximum output level.
- Dynamic Range: 105dB minimum, 20KHz bandwidth, Ref. 1KHz, A-weighted.
- Signal to Noise Ratio: 105 typical, idle channel, A-weighted.
- Crosstalk: -90dB Right - Left, -120dB Center-Left @ 20KHz.

Block Diagram:
1. Theta Digital Corporation, henceforth referred to as Theta, warrants the product designated herein to be free of manufacturing defects in material and workmanship, subject to the conditions set forth herein, for a period of 90 days from the date of purchase by the original purchaser, henceforth referred to as purchaser. If the purchaser registers the unit with Theta by mailing in the warranty card, together with a copy of the bill of sale, within 14 days of the date of purchase, said purchaser will be registered for an extended service contract. The extended service contract extends the 90 days to a period of 5 years from the date of purchase by the original purchaser or no later than 7 years from the date of shipment to the authorized Theta dealer, whichever comes first.

2. CONDITIONS
This warranty is subject to the following conditions and limitations. The warranty is void and inapplicable if the product has been used or handled other than in accordance with the instructions in the owner's manual, abused or misused, damaged by accident or neglect or in being transported, or if the defect is due to the product being repaired or tampered with or modified by anyone other than Theta or an authorized Theta repair center. In the unlikely event that the unit requires service, contact Theta for an RA (Return Authorization) number. The product must be packed and returned to Theta or an authorized Theta repair center by the customer at his or her sole expense. Theta will pay return freight of its choice. A returned product must be accompanied by a written description of the defect, a photocopy of the original purchase receipt, and a daytime phone number where the owner can be reached. The unaltered receipt must clearly list model and serial number, the date of purchase, the name and address of the purchaser and authorized dealer and the purchase price. Theta reserves the right to modify the design of any product without obligation to purchasers of previously manufactured products and to change the prices or specifications of any product without notice or obligation to any person. The warranty is valid only in the country in which the unit was purchased.

3. REMEDY
In the event the above product fails to meet the warranty, and the above conditions have been met, the purchaser's sole remedy under the limited warranty shall be to obtain an RA number and return the product to Theta or an authorized Theta repair center where the defect will be rectified without charge for parts or labor.

4. LIMITED TO ORIGINAL PURCHASER
This warranty is for the sole benefit of the original purchaser of the covered product and shall not be transferred to a subsequent purchaser of the product.

5. DURATION OF WARRANTY
This warranty expires 90 days after the date of original purchase. If Theta receives the completed warranty registration card within 14 days of original purchase, this period is extended to the fifth anniversary of the original date of purchase or no later that the seventh anniversary of the shipment to the authorized Theta dealer, whichever comes first.

6. MISCELLANEOUS
ANY IMPLIED WARRANTIES RELATING TO THE ABOVE PRODUCT SHALL BE LIMITED TO THE DURATION OF THIS WARRANTY. THE WARRANTY DOES NOT EXTEND TO ANY INCIDENTAL OR CONSEQUENTIAL COSTS OR DAMAGES TO THE PURCHASER. Some states do not allow limitations on how long an implied warranty lasts or an exclusion or limitation of incidental or consequential damages, so the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

Theta does not warrant that the operation of this product will be uninterrupted or error free. Theta is not responsible for damage that occurs as a result of user failure to follow the instructions intended for Theta products.

7. WARRANTOR
Inquiries regarding the above limited warranty may be sent to the following address:
THETA DIGITAL
1749 Chapin Road
Montebello, CA., 90640
USA

WARRANTY OUTSIDE THE USA
Theta has formal distribution in many of the countries of the free world, in each country the Theta Importer has contractually accepted the responsibility for product warranty. Warranty service should normally be obtained from the importing dealer or distributor from whom you obtained your product.

WARNINGS
1. To prevent fire or shock hazard, do not expose your Theta product to rain or moisture.
2. This unit contains voltages which can cause serious injury or death. Do not operate with covers removed. Refer all servicing to your authorized Theta dealer.
3. For continued protection against fire hazard, replace fuses only with the same type and rating of fuses as specified.
