

"As they rightly said, it (Dirac Live) is the best \$4K you can spend to improve the sound of your system. If you have a Theta processor, it is a must have upgrade in my opinion."

By Amir M

I finally got to hear Dirac again and this time it was a far better experience than what they did at CEDIA. This was at the Theta suite at CES so I can share my experience with that here.

They had it nicely set up and switched back and forth for me so I could hear with or without correct (Datasat folks would not do that at CEDIA). The system worked very well. No comparison to what Datasat had done at CEDIA. Despite the system being very high end, the improvements were apparent and considerable. The graph showed massive low frequency aberrations prior to correction as expected and resolving that showed that the system is a very capable room EQ.

I also sat through the demo of the software. It was very simple to use. I shot a video of it that I will upload later to WBF.

The hardware option is due to ship in April I think.

As they rightly said, it is the best \$4K you can spend to improve the sound of your system. If you have a Theta processor, it is a must have upgrade in my opinion.

Here is a shot of the suite. More later on WBF:
